I purchased an old NYE SSK-1-K keyer. On this keyer, the left paddle is "dits" and the right paddle is "dahs". Is this wired correctly for a right-handed person? I am right-handed and don't want to learn to use this thing if it is wired backward.....Thanks for any info.....

4. *F.S. Yaesu FT-900AT

Nice Yaesu Ft-900AT for sale.
No scratches, works 100% and just had checkup and firmware update from yaesu ($140)
Including seperation cable and mounting hardware if you want to remote mount the control head, Mic, manual and box.
This is a nice radio and has a very fast auto tuner!!

$750.00 and will split shipping

Source record: 78353
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Hi, I'm comparing the 706MKIIG and the FT-100. Is there anything for the FT-100, either an add on or a mode/setting built into the radio, similar to the IC-706 tune control (that little box that goes on the back that gives you 10 watts CW so you can tune your antenna)? I'm looking to push one or two buttons and have the FT-100 give me 10w CW, without going in and changing a bunch of settings, and without having to hold the ptt closed. Thanks,
Mike

Have tried both. Have load tested both on a lab load tester, and the
Astron wins. The Astron is also much quieter, though neither put
out much hash the Astron pretty much puts out none. The Singer
RFI receiver could not detect any hash external to the Astron
supply at all.

Looking for comments on both of these dual-banders.

Scan speed....I hope these newer rigs are faster than my Kenwd 733.
Comments?

How about out-of-band sensitivity? For example the 150-165Mhz and
450-465Mhz ranges.

Does either rig receive 800-950Mhz? Less cellular (of course).

Al, W2JUV

Hi dean,

The feed line to the battery... is it coax or regular wire?? If it isn't coax, try running a section or RG8 as your power feed directly off the battery.

Good luck es 73,

Yah don't really keep the Mercury vapor light, but replace it with a better,
shielded light.

My garage/shop has 2 250 watt floods on each corner but they are seldom on.
Even when tripped they illuminate the area around the garage instead of the
sky, or whole neighborhood.

Actually each corner has its own sensor. I can also turn them on manually if
I wish.

24. Crossband repeater question

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-01 00:00:00 UTC
From: Dave Horoschak <dth@snip.net>
Message-ID: <39360D8A.93F26AFD@snip.net>
Source record: 78416
Cross-posted to: alt.ham-radio.vhf-uhf,alt.ham-radio.fm,rec.radio.amateur.equipment,rec.radio.amateur.misc

I'm looking for an HT to be used with my Kenwood mobile radio. I want to use the mobile system as a crossband repeater. My questions are:

1. Why is a dual band HT required? Shouldn't the HT just talk simplex to the mobile radio on one band (the repeated version of the original signal) until it sees a signal on the HT TX freq at which point it changes the original freq to TX?

2. I can see why you would need dual band for a fixed band repeater - because the HT is the only receiver since the only thing being repeated is the TX from the HT. Right?

3. Assuming I do need a dual band HT, is the correct way to set this up to set the mobile radio as though it were going to transmit & receive on both bands, and set up the non-HT band as the control. (I think this is right according to the manual.) Then set up the HT to simplex mode on both frequencies. (the repeated frequency and the original)

I guess what I really don't understand is why the HT needs to be set with the original frequnecy when the repeater is repeating it on the new band anyway.

Can any provide some clarification?

Thanks.
- Dave

25. Re: Crossband repeater question

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-01 00:00:00 UTC
From: Matt <doormatt@NOSPAMbigpond.com>
Message-ID: <cKoZ4.10050$c5.16266@newsfeeds.bigpond.com>
Source record: 78417
Cross-posted to: alt.ham-radio.vhf-uhf,alt.ham-radio.fm,rec.radio.amateur.equipment,rec.radio.amateur.misc

The way I do it is with a dual band HT and a dual band mobile - not because the HT has to be dual band but because that way I have the option of how I want to set it up. For example I could park my 4WD on a hill top and use it as a cross band repeater (whilst I go hunting or walking), set up on 2 freq's - one 2metre freq and one 70cm freq. I have found that the best way to use the setup is to have the 2 metre frequency linking to me whilst I am walking around and the 70cm freq linking to a repeater or to a friends place.
The way it works is that I transmit on 2metres on my HT, and my mobile in the car receives me on 2 metres and simultaneously retransmits my signal out on 70 cm, therefore "crossbanding" my signal.
It works the same coming the opposite way, the 70cm repeater (or my friend) transmits a signal on 70cm which is then picked up by the 70cm receiver in my car and is then simultaneously retransmitted on 2m which I then pick up on my handheld.
The benefit of this sort of system is that I can be in a radio "blackspot" and still get out to the rest of the world - as long as I don't move out of range from my car.
As you can see you don't have to have a dual band HT, however you might want to put a signal into a 2m repeater from your crossbanding radio which would necessitate a 70cm HT. Instead of having two HT's (i.e. one 2metre and one 70cm HT) a dual band is more convenient.
You could of course construct your own portable repeater but why bother when your dualband radio will do the same job - albeight somewhat differently.

Cheers

Matt

If your Kenwood mobile is the TM-V7A it does exactly that from what I've read in the manual. Please note I have NOT tried it myself so can't guarantee it.

Stew

Matt, how do you ID the transmitted signal that goes back to your
HT?

Well, there's two issues here.

One is 'practical'. In that sense, the mobile is listening on one band and playing it out on the other. With that in mind, once it starts it won't stop, until the input stops. So do you really want to set up BOTH directions? Remember, if you use it to listen to access a repeater with a monoband HT, it will CONTINUE to transmit the repeater output to you until the repeater tail drops. That can make it VERY difficult to get 'back into' a repeater. I've seen repeaters that take 15 seconds to drop the tail. Even with quick tails on the repeater, if ANYONE ELSE gets in, you won't, cause your mobile will never drop and change over to where YOU can transmit through it. (This is something almost NO-ONE ever thinks about in advance when they set these things up!)

So in a practical sense, use a DUAL band HT. Have the HT actually listen to the freqency you want to receive, and use only half the mobile as a cross band repeat to get high power back to the repeater.

If you mean simplex to talk to someone, then it's actually easier to let the mobile do it both ways.

Now for the 'other' issue. The legality...

One part of the legality is the ID of the mobile unit. You should ID on ALL output frequencies. So if you are only using the mobile for the outgoing direction, that's easy, ID on your HT, and you ID on the mobile. But if it's in BOTH directions, you need to be able to ID through the mobile there as well, so in that case, you need a dualband HT (or a second HT) to be able to transmit the ID so that it's repeatable on BOTH output bands of the mobile.

Now another little 'gotcha' most people don't consider. To run a mobile like this you have to 'control' it. If it's parked in the driveway outside a house, you could argue you're still in control, but what about leaving the vehicle for even a short time somewhere? Where is the control? Through your HT, right? But remember, you MUST be above 222Mhz for control operations, which means you MUST have a 440 link to be in control. It's not illegal to actually use the 2M side to control the radio, but legally you must STILL HAVE the 440 link available (and functional) for the link to be legal.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

Sam.... I just got finished doing a relay job on my FT102. It was a piece of cake! Took more effort locating the relays then anything else. Got them all from Mouser.
Make sure to check out this website for the relay replacement info. Have a good solder iron, Japanese screwdrivers (JIS), and a solder removing station. Otherwise, send the 102 to the guy that advertises in the back of QST.
All he works on is the FT102, and does a first rate job.
Here is web site.....
http://www.geocities.com/SiliconValley/6992/ft102.htm
Regards....Dave

I have one FTV901 transverter with 6m, 2m, and 430 modules. It has
been modified to work with a Yeasu FT-102. I am asking $400.00 plus shipping.

No I do NOT want to sell the modules seperately.

Thank you for reading this.

From: Jim Gerke <Jim.Gerke@usa.alcatel.com>
Message-ID: <39369E15.2913E5E@usa.alcatel.com>
Source record: 78432

Dean,

Is this the back-lit mic? If so, the problem is likely NOT the actual switch, but the little foam pad that fits between the PTT button and the microswitch itself. Over time the foam compresses, resulting in the switch not closing when the button is pushed, or, after only a few seconds of transmitting, the TX will drop out .

Assuming it is the back-lit mic, throw away the piece of foam, insert a short 4-40 screw into the hole in the back of the PTT button, and your problem will be solved. You will have carefully adjust the length of the screw so as not to break the microswitch, but the problem will go away.

I did this to mine about 3 years ago and have not had any trouble since.

Dave a dualband H/T is not necessary, although several others have pointed out good reasons for using one, I do, myself. I use the xbr in my car to relay the local 2m repeater on 440mhz so I can receive it inside a steel building at work. I use the 2m side of my H/T to monitor the output of my mobile to the local repeater. As for the legal ID matter, I would suspect that the FCC would view your IDing on the H/T as complying with the spirit of the law, even though the xbr mobile doesn't ID itself. After all, the FCC did type-accept these radios.

I tried this many years ago with mixed results. The crossband mobile
repeater won't switch to the other mode until the repeater drops
carrier. This is, of course, a problem in a rolling qso between 8
hams on a repeater with a 10 second squelch tail.

Yaesu had the right idea long ago. I have a BIG Yaesu "half-duplex"
HT whos model number escapes me at the moment. I set my mobile dual
band repeater to listen to an odd, totally unused UHF frequency and
the VHF side to transmit on the repeater input freq and listen to
144.000 with tight squelch....so it never heard anything on VHF to
switch the link. The HT was set to transmit on the odd UHF frequency
of the car's receiver and receive DIRECTLY on the repeater's output
freq on VHF.....half duplex.

In use, I'd be transmitting on UHF to the car on the lowest power the
HT had, 1/2 w. The car would retransmit the HT on the repeater input
frequency but NEVER receive on VHF to switch it....half duplex car.
The repeater would be listened to, DIRECTLY, for all the other
stations. AS the system never needed to let the carrier drop and my
50W transmitter in the car was on the repeater input, noone noticed I
was actually sitting at the bar at my favorite watering hole, unless,
of course, they could hear the giggling of my companion in the
background....(c;

73, Larry W4CSC
Maybe I'll dig up that old HT. It's here, somewheres.

You can have two types of "cross-band" repeat setups. One way is to set up the mobile radio to receive on 2 meters (your usual setup I.E. 146.34 input/146.94 output) and transmit and receive on a 440 simplex frequency. You would listen on your HT to the 440 simplex frequency. When you wanted to transmit you would transmit on the 440 simplex frequency and your mobile rig would retransmit your signal on 2 meters. As pointed out in another post the repeater would have to drop completely before you could transmit. This mode is helpful when you are in a building and cannot hear the 2 meter repeater. This is duplex cross-band and would only require a 440 HT.

The second way is to set up your mobile to listen on a 440 simplex frequency and transmit on 2 meters only on the repeater input frequency. You would use a dual band HT to listen to the repeater. When you transmitted, the mobile would retransmit your signal on the input of the repeater. The nice thing here is you do not have to wait for the repeater to drop out.

The "secret" to either method is to PL wherever possible. You should definitely PL the 440 frequency (your choice of PL tones - I suggest a tone lower than 100.0 to avoid hearing the tone)! It is to your advantage to choose one of the recommended mobile cross-band frequencies for your area. If your favorite repeater is not PL'ed, you should think about PL'ing the 2 meter side. That way, if someone is talking on the input you can still key up your transmitter. I know the Yaesu radios will not let you transmit if it hears someone on the input (the radio is unsquelched). Adding a PL means the radio is not unsquelched, and you can transmit. Obviously if your favorite repeater is PL'ed you will have to PL the 2 meter side with that PL tone.

Hope this helps
Max

I finally got hold of my new TM-D700A rig. So far, I love it. It's really a great rig. I can't wait to instal it in my car. Which leads me to think about how I am going to instal it in my car.

I am going to mount the black box under my XYL's front seat. I have got plenty of cable to remote mount the display but I'm probably going to be a little bit short with the mic cord (which should be plugged in the remote display instead of the black box... But that's another story...). I really find it outrageous to have to fork 100$ CDN for the PG-4X extention cables so I am looking for ways to solve my problem.

After looking at the situation for a while, I concluded that I could probably use a shielded Ethernet cable with a female to female RJ-45 adapter to join the mic cord with the ethernet cable. To prevent RFI, I would use ferrite at both ends of the ethernet cable. I also thought about using an unshielded ethernet cable but since there is only a difference of a couple of $$$, I might as well got with the shielded one.

Has it been done before and if not, what do you think of my idea ?

I would really appreciate your comments on this one.

Stay safe !

On another thread, a new General asked for some advice on HF equipment.
It was suggested that a $1500 rig was what was needed.

Your question is more along the lines that I would be interested in:
What is the best way to get into HF without having to spend an arm and
both legs? What bands? What CW equipment? What antennas?

**** YES! This software is now updated to reflect the April 15th
**** changes in FCC licencing structure for Amateur Radio. The software
**** contains questions for the new and old ham tests as well as
**** the unchanged professional tests.

Greetings!

dauntless-soft.com is pleased to offer high quality MS-Windows test
preparation software for the FCC/HAM plus some Professional tests
available for shareware download at http://www.dauntless-soft.com.
(aka http://www.hamexam.com -- easy to remember address--tell your
mates!) The program will drill you for the following elements:

ELEMENT
2 (NEW) Technician
3 (NEW) General
4 (NEW) Extra
2 (pre April 14, 2000) Novice
3A (pre April 14, 2000) Technician
3B (pre April 14, 2000) General
4A (pre April 14, 2000) Advanced
4B (pre April 14, 2000) Extra
1 GROL Basic Radio Law
3 GROL General Radiotelephone
7 Radar Endorsement - Ship Radar Techniques
8 GMDSS Radio Operating Practices
9 GMDSS Radio Maintenance

You are welcome to download this and give it a try. Secure online
registration is available--a $30 registration unlocks ALL the questions
and entitles you to FREE LIFETIME UNLIMITED UPGRADES of the
software. That's less than $3/test.

This software is based around the same engine that drives our FAA test
prep software that has helped many pilots score very highly on those
exams. (Yes, we got a new hobby and decided it was time to write
software for it, too!)

Thanks for your time. We look forward to your visit!

52. Mirage V/UHF amplifiers any good on SSB?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-01 00:00:00 UTC
From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <sjdfo91i5ri112@corp.supernews.com>
Source record: 78444

How linear are the Mirage D1010N 70cm amplifier and the B2516G 2m amplifier on SSB? I found the power curves for both on the Texas Towers web site. From what I can see the power curves for both are not linear, in fact, the 70cm one looks like it is not usable above 75 to 80 watts where there is a sharp bend in the power input v.s. output curve. The 2m amplifier power curve is not as bad.

I am more interested in the 70cm amplifier, than the 2m one, which I want to use to boost the output of a mobile IC-706MKIIG rig on 70cm. I know both amplifiers would work fine on FM, but I also want to know how well they perform on SSB.

I did some analysis using Mathcad to calculate the IMD performance under two tone test conditions, using the power curves, and the results don't look good for either amplifier. So now I am interested I getting some "real-world" comments from anyone who has one of the above amplifiers, to compare to my analysis, before I drop any money to get one or both of these amplifiers.

Wrong. You're thinking of the earlier HW-2036 (mine is the "A"
version). The "A" version covered the whole 4 MHz of 2 meters.
The manual makes this quite clear.

>so selective that once you crossed the 146MHz boundary it should die.

Hi Lyle,

I agree. It's acting as though it has some logic that's set up to do this. There is some circuit that cuts the synthesizer off when you go outside of the 2m ham band, but the "synth unlock" LED comes on in those cases. With this one, there isn't any fading away or gradual degradation when you move outside the 146-147 MHz range, like you'd see if there was a problem with the tuned circuits being out of whack. It quits hard when the requested frequency is so much as 5 KHz outside the range of 146.000 through 147.995 MHz. If you go to 145.995, it's dead. Same thing for 148.000, it'll be dead. The meter indicates some transmit power, but I think it's probably spurious output rather than a real signal. There's no definite receive, only random noise and intermod. It will not pick up a genuine 2m signal, although there's some slight amount of receiver de-sense when the signal (from my other 2m rig) is present. The "synth unlock" LED does not come on as long as the set is tuned inside the 2m ham band.

Thanks Andy for the response.

Since I'm only receiving (I have no HF antenna), I am using
various mag mounts, and then a 40 foot long piece of coax
terminated on each end with a PL259. All of these offer
excellent reception, unless the connector is plugged all the way
in. First time I have seen anything like this. I will check
the feeds per your suggestions, this might shed a little light
on the problem!

thanks again
John

Dean,

your vehicle has an in-tank electric fuel pump that makes loads of HF RF hash. Test to see if it's the fuel pump:

With the HF receiver on, turn the key to the "run" position without cranking the engine. Does the S7 noise level appear for approx. 2 seconds, then vanish?

If yes, it's the fuel pump. The tank will need to be dropped and a kit installed. At one time, Ford could order a kit - for about $65 - but good bypassing and filtering (and insulation!) will work.

I ran HF mobile in 4 different Fords with electric fuel pumps, and had this noise in all until the pump motors were bypassed. .01ufs in shunt and about 10 turns on a 1" toroid on the power lead did the trick.

68. Warranty Card Information / vs/ Original Receipt

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: K5JOE <k5joe@k5joe.com>
Message-ID: <39382128.E8F13A68@k5joe.com>
Source record: 78310

It has been my experience with manufacturers of ham rigs, that unless you have the receipt for the radio that you are sending in for warranty repair, they will not honor the warranty repair just because you have a warranty card. SO, if you buy a rig that the seller says has not had the warranty card filled out , get him to send the original receipt with the rig or no warranty work will be done on the equipment. I found out that the hard way and just wanted to let someone else know the facts.

Sounds completely normal to me. You don't specify what if any antenna is
connected to the far end of the coax, If there is none, why wouldn't you want
the receiver to go dead when you hooked up the cable.

Before the shield ring makes contact, you have in effect a random length wire
plugged in. When contact is made you have a shielded connection. No shorts are
involved. If you have for instance a 10 meter dipole as the antenna, you might
well expect that the "random wire" make a better BC band antenna than it does.

Source record: 78317

I have a number of antennas that behave exactly as you describe. In each case the antenna is fairly short and the coax is fairly long. The long coax with the shield disconnected makes a pretty good random wire antenna. Once you connect the coax all you have is the real antenna picking up signal.

An overly simple way to look at reception is that the signal comes in at a specific number of microvolts per meter. The more meters of antenna you put out the more microvolts you get.

Paul,

You can find Kenwood manuals at

ftp://216.98.255.24/Amateur/Instruction%20Manuals/

Get the TS570D_S_G.pdf file (S version includes 6 meters; same manual
covers both).

There is a link there from the Kenwood web site:

http://www.kenwood.net/ama_page.cfm

I've been very pleased with my TS-570DG (originally a D, now factory
converted to a DG).

Phil

83. Batt for IC 2 GAT

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: castles@jps.net
Message-ID: <WRXZ4.5801$AW3.162377@nntp3.onemain.com>
Source record: 78325

Where is the best place to get a replacement battery pack for the IC 2 GAT?

Does anyone out there have one of the battery holders for the 8 AA cells they would be willing to sell?

Any experiences in replacing the batteries? Of the 11 cells in mine only 4 are still good. If you have had success, where is a good place to buy the batteries?
It also appears that there is some sort of fuse or breaker wired in with the batteries.

Thanks for forwarding any experience you have had with the IC 2 GAT or equivalent battery issues.

I've had one for several years. It is ok for a midrange xcvr. It IMD rating is a little low. IE It doesn't like a strong signal next to your qso. The only thing that helps is to get a full set of xtal filters. I have them and am glad I put out the $$$ for them. Frankly, I wouldn't have the rig, or any rig without them..

Thanks to all who responded,

I need to bone up on my antenna theory!

I see now that there is an 'rf' electrical difference between a
shielded antenna and a non-shielded long wire.

Thank goodness I'm not transmitting and then asking questions!

86. Kenwood TS-450S/AT Antenna Tuner question

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: technocrat <jbohanejrNOjbSPAM@juno.com.invalid>
Message-ID: <1ac21460.bd1c4949@usw-ex0103-018.remarq.com>
Source record: 78328

Hello to the group,

My users manual for the TS-450S/AT tells me that there is a protective circuit in the receiver in cases where the SWR is >= 3:1.

During the auto-tune process, I have noticed several times that the SWR indicator shows what appears to be a good match, say 1.5:1 for example, yet the tuning process times out after 20 seconds and gives the warning alarm....all the while the SWR indicator sticking to the 1.5:1 indication.

At other times, on a different band for example, I can clearly see that the SWR meter indicates infinity, and I can see the tuner at work, bringing the SWR under 3:1, and giving me a success beep in much less than the 20 second limit.

I can't understand why the tune process would give me a warning alarm after 20 seconds when the process indicator SWR clearly shows an acceptable match!

Any help appreciated!

John KA1HIC

87. Re: Kenwood 570S(G) vs Icom 746 help...

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: John Wagner <john@neknetwork.com>
Message-ID: <39385923.8B4DB48E@neknetwork.com>
Source record: 78329

I just went through the "IC-746, YAESU FT-847, FT-920, Knwd 570 decision myself this week. I ended up going with the IC-746, which I just put on the air for the first time yesterday.

I'm primarily a CW op. The dual PBT coupled with the dual 500 hz filters I bought make this rig AN ABSOLUTE DREAM on 40 meters. Last night I was easily able to cut out any and all noise and carry on a QSO as if I was on 10 meters instead of 40. Really, the filtering is that good. It also has a neat audio peak filter built in (DSP) that can boost a section that you're receiving as narrow as 80 Hz. The display is really nice, has a built in keyer, 4 CW memories and a limited, but very useful band scope. This rig is loaded with features, I'm really happy with it.

I used the rig on 40 meter LSB today as well to talk to a friend down in New Hampshire. The audio on receive was crystal clear, and again the filtering made it almost like a telephone conversation. I'm not a big SSB user, so I really couldn't tell you if this is a normal expectation.

Anyway, every email I received in response to my post was positive towards the IC-746. Most people said the FT-920 was a good rig as well. I really didn't get much feedback on the 570 at all. Something else I noticed is there are quite a few "will trade for a 746" posts in the various online listings, but very few saying "will trade 746 for ..." .

Good luck, let me know what you end up with. 73,

John, KB1ENS

I think the Kenwood is the best rig for the money on the market today. The ICOM is overpriced and not for those who want to operate in any contests or field-day modes. The Kenwood hears much better if you know anything about receivers.

Kenwood TM-241a in very nice condition with box, manual, mic, cord and
generic mobile bracket. Works 100%. Used for my packet station.

$125 shipped conus.

AEA model PK-88 Packet TNC with original manual + cable for Kenwood 8-pin
transceiver (like the 241 above). In excellent condition.
$45 shipped conus.

MFJ 812B 2m/220 SWR/Wattmeter. With instruction sheet
$20 shipped conus.

Will entertain offers for the entire package, and would trade for any of the
following: MFJ 9440, 9475, 9406, 9420 or what have you...

Thanks and 73,

Gary K7MHZ

Body handling: HTML body converted to readable text

Keep in mind that the VX-5R is smaller than the FT-50RD and will get much hotter, or hotter quicker, when operating at high power. I also read somewhere about the CTCSS decode function, I think, does not work and Yaesu needs to fix almost all the first production run of the rig. So it goes, new rig, new bugs.

A dual band HT is NOT required - A dual band mobile is - as long as it repeats
in BOTH directions.

> 2. I can see why you would need dual band for a fixed band repeater -

Since the days of the "bug" the left paddle has been dits and the right paddle
used for dahs for right handed ops. On the bug it took quite a "slap" on the
dits side to send a string of quick dits and the thumb is stronger than the
fingers.

98. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8h7fgbijv1@news.hawaii.edu>
Source record: 78361
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

99. Re: Mirage V/UHF amplifiers any good on SSB?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: arp94539@my-deja.com
Message-ID: <8h7hf3$2f0$1@nnrp1.deja.com>
Source record: 78362

Most of the VHF/UHF solid state linear amplifiers have linearity problems because the bias supply can not supply enough current during input peaks. If I recall correctly the typical 160 Watt VHF amp requires 1.5 amps of bias current with 40 watts of drive to the final stage. In most of these amps the bias is supplies by forward biasing a silicon diode which acts as a shunt regulator that has roughly the same temperature coefficient as the RF PA transistors. Most designs do not operate with enough standing current in the diode to supply 1.5 amps and maintain the bias voltage. The correct approach is to use an active bias regulator. G3SEKs web site http://www.ifwtech.demon.co.uk/g3sek/tr-bias/tr-bias1.htm has a good article on this topic and a good active bias regulator design. There was also
a presentation on this issue at a VHF conference several years ago. The paper is in the proceedings from that conference. The author made basically the same observation that you made and concluded that the problem was poor bias regulation. The paper showed before and after input output curves for the amplifier that he added the active bias regulator to.
If you would like more information on this topic the design of bias regulators is covered fairly extensively in "Radio Frequency Transistors : Principles and Practical Applications", by Norm Dye and Helge Granberg. I believe Mirage, RF Concepts, and TE systems use a shunt diode as the bias regulator in their amp designs but it should be possible to modify them to use a active bias regulator and considerably improve the linearity at the higher power levels. I need to do that to most of my solid state VHF and UHF amps.

Hello,

I have a nice Yaesu FT-900/AT for sale.

Comes with Manual and Separation Cable. This rig has been mobile and has some light scratches on its sides from mobile bracket (not included). This rig comes with the standard hand mic, super fast tuner and great audio reports.

This is my back up rig and I have decided to pass it along.

$750.00 Shipped Cont. U.S.

Thanks! & 73

Yaesu FT-50R with the following for sale. Must sell due to health problem.

Unit in 10/10 condition
Includes:

FT-50R with FTT-12 Voice recorder keypad
1 - 9.6V NiCd, great shape with clip
1 - 6V NiCd, great shape w/ clip
Standard charger
Original box, manual and schematics
ADMS-1E software and programming cable
Stock antenna
Leather belt case with quick remove belt loop

A great system, I'd love to keep but need the money. Unit has been MARS/CAP modded. Asking $300 plus shipping. Click on below link for photo

106. Help! Heathkit HW-2036A problem

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: k5dh@raytheon.com
Message-ID: <04OZ4.32$x75.6751@bos-service2.ext.raytheon.com>
Source record: 78369

Hello, Heathkit fans!

I just acquired a Heathkit HW-2036A 2m FM xcvr with the Micoder DTMF hand mic and HWA-2036-3 power supply. It came from an estate and had been unused for some time. The FCC ID label inside says it was built in 1978 by James Coke, WA5AMY.

The works fine from 146.000 through 147.995 MHz, with decent receive, full power output, good transmit audio, working PL tones, and working DTMF pad on the mic, but it won't transmit or receive from 144.000 MHz through 145.995 MHz. The "synth lock" LED does not come on unless the thumbwheel switches are set to an invalid frequency (above 148 or below 144 MHz). The relative output meter indicates about 1/2 the normal power output level from 144 through 145.995 MHz, but I can't find a signal on an outboard receiver, and my frequency counter only goes to 50 MHz (I know, I need a better counter!). Can anyone enlighten me with a potential fix?

>
>Mark K5MAR

You misunderstand the Type Certification of the Amateur Radios.
The Type Certification only pertains to the receiver and it's
radiation of various frequencies against FCC Part 15 rules.

Nothing is done to test other functions of the amateur transceiver.
Nor is the transmitter actually tested beyond the manufacturers own
certification the product meets FCC Part 97 rules. One exception is
an HF power amplifier as it must comply not being able to operate on
24 to 28 MHz when sold new in the US. HF transceivers so long as
their receivers operate below 30 MHz carry NO Type Certification
number at all and are not tested by a FCC testing facility..

Go to www.fcc.gov/oet and look up your radios type acceptance number.
You can enter in the first 3 letters or the whole number.
You will most likely find it Type Certified as a scanning receiver.
According to the FCC database an FCC examiner will have no clue that
product transmits. I have fielded many of those calls at my work
place where the FCC engineer did not understand that "scanning
receiver" actually transmitted.

Remember the Amateur Operator is solely responsible for proper and
legal station operation regardless of the capabilities of the product
he is using.

Hello Larry,

I have a like new out of the box Yaesu VX-5R for sale. I'm telling you Larry this radio is like new, the box and manual are "perfect" with no dents or imperfections. I haven't even sent in the Warrant Card yet. Purchased about 5 months ago. Comes with the E-DC-15 Cig. Lighter adapter w/ filter, like new. You couldn't get a VX-5R used...that was as new....(never opened up, is in factory condtion, no modifications - as is out of the box)

$300.00 Shipped Cont. US

Reason for selling, looking for a used Yaesu FT-920... I have the bug! =)

Well that pretty much confirms my guess that these amplifiers are primarily designed for FM/CW use where you don't care about the linearly of the input to output. It is also very interesting the QST product review I read does not even test the amplifier in the "linear" mode. Since you mentioned you have modified your V/UHF amplifiers to use an active bias regulator, have you done this for any of the Mirage models?

I have an old Motorola RF transistor data manual which has a reference design for a high power HF amplifier using 300 watt modules using an active bias. Would the bias design used on those 300 modules be the same bias arrangement you are referring too?

What are your recommendations relative to HF bands and reasonably priced
equipment for someone just entering HF?

I know that band activity is somewhat related to weather and time of
day. And I know that one can probably find CW and phone on most bands.
But if one can only start with one or two, what would be appropriate?

Crossbanding is QUITE legal. NOTHING illegal about it in the US.

What can be illegal is how it is USED.

Gary,
Not saying you're wrong, I don't have all the facts, but, if the FCC only tests emissions for type acceptance, then why is Kenwood having problems getting it's new Sky Command radio system type-accepted. As I understand it, from what I've read, it has to do with the way the radio(s) implement remote-control/cross-band operations. Not an emissions problem, an operations problem.

Sorry!
This Heathkit could only "do" any 2 MHz of the 2 meter band.
You can de-pot the coil and re-tune it to the lower portion of the band,

but they were sealed with EPOXY!

123. HF coax connection problem

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-02 00:00:00 UTC
From: technocrat <jbohanejrNOjbSPAM@juno.com.invalid>
Message-ID: <0a6fd2df.27fee66e@usw-ex0104-031.remarq.com>
Source record: 78386

Hello to the group,

I just purchased a Kenwood TS-450S/AT, and I am noticing a problem with the feedline connection. I am using the rig for RX only right now, and I notice that when the center conductor of the feedline pl-259 makes contact with the female counterpart, signals accross all bands come in fine. However, if I push the plug in all the way, _or_ if the threaded shield ring makes contact with its counterpart, all signals are severely attenuated.

In the AM broadcast portion of the receiver, for example, all signals disappear except one extremely strong station whose transmitter site is only 1/2 mile from me, and that signal is very attenuated.

Is this simply a matter of a faulty female connector on the rig? I have tried two different antennas, both using the standard pl-259 connector, and one very long piece of coax using the same connector. The same problem occurs regardless of which setup I use.

Any help appreciated!

True for the original version of the 2036, but the 2036A features 4MHz operation. There was even a mod kit - a few parts that you'd install to open up the operating range to 4MHz. Mostly a few caps changed here and there, and then realigned.

Still thinking about the original problem though. As long as the synth is in lock you should be getting something out of it. Those circuits weren't so selective that once you crossed the 146MHz boundary it should die.

Sounds like a short somewhere along the coax line. You didn't say what type of antenna you are using. If its an antenna that is not supposed to be directly coupled to ground, such as a dipole or inverted "V", use a VOM and measure across center conductor to the shield. If it shows anything but "infinity" then that is your problem. If possible, disconnect the feedline from the antenna, measure again. If you still get any reading other than "infinity", it is the coax or connector(s).

If its an antenna that couples to ground, then you may need an antenna analyzer to help you trouble shoot where the problem is.

I have in good condition two 212Z-1 Remote Amplifiers. These are solid state, 4 Channel AC or Battery operated portables in cases for on the spot broadcasts. Freq response 50-15KHz gain 90dB. These are excellent for AM Transmitters requiring line level audio input. Built in 400Hz tone for setups and program monitor for headphones. All XLR inputs and also telephone connections. With a really large VU Meter in the center makes it a real great addition to any station. $425 each plus shipping.

>
>

I've been very pleased with my TS-570DG, both on CW and SSB. A major element in my choice was support. I live in the LA area and both Kenwood and Yaesu have service facilities here, and I've had very good and prompt support from both over the years. Icom 's service facility is near Seattle

I also had a bad experience with an Icom radio, in that regard. Even drove it there on the way to Canada .. but the problem was not fixable, they said ... and the problem (loud PL on FM) is still there, since there is no PL dev adjustment in the radio (IC-706MkII), so I use it only on HF where it perfoms admirably.

So all other things being equal, I go with Kenwood or Yaesu. But my best/favorite radio is an Elecraft K2 which I buit myself.

Re performance: the ARRL member's only area has extensive and quatitative test data on all radios they have reviewed.

Phil

>into the proper programming mode for doing things like PL tones etc.

I discovered one day that I could control the *idiotic joystick*
much more easily using a stylus or pen like you use with a palm
pilot type computer. I think that horrible switch might even
nhave been lifted from a computer intended for stylus operating,
not actually intended for human fingers at all.

Interestingly, if I use the stylus to push the round button in
the center indent I can hit the correct switchc ontact EVERY time
even if I deliberately push off axis. While it is a horrible design
to be sure, the stylus has been a work-around worthwhile.

Best is airplane ignition cable but it costs.
Poor man's way: wrap each with number 18 stranded 1 turn
per inch and ground all at distributor. Use plastic ties.
No need to ground at plugs.
Reduces S7-8 to S1. YMMV
Also get 12 inch strap from NAPA and ground engine to frame.

IC-2350H 2M/440 MHz Dual Band Mobile

Dimensions: 5.5 (W), 1.6 (H), 8.1 (D), 2.6 lb
2 M (50 W) 440 MHz (35 W)
Wide Band Rx (118 MHz - 174 MHz)
110 Memory Channels
PL Encode Built-in
Built-in Duplexer
Auto Repeater Shift
Seven Scan Modes, including Fast Scan
Tone Scan (Opt. UT-89) Included

IC-2350H SPECIFICATIONS

GENERAL
Frequency Coverage:

VHF:
Transmit: 144.00-148.00 MHz
Receive: 118-174* MHz (*guaranteed 144-148)
UHF: 440.00-450.00 MHz
Mode: FM
Number of memory channels: 110 (100 regular, 2 call, 4 scratch pads and 4 scan edges)
Antenna Impedance: 50 ohms (nominal)
Power Supply Requirement: 13.8 V DC+/-15% (11.5 A)
Usable Temperature Range: -10�C to +60�C; +14�F to +140�F
Frequency stability: Less than ±10 ppm
Tuning step increment: 5, 10, 12.5, 15, 20, 25, 30 or 50 kHz
Current Drain (at 13.8 V DC):
Transmit at high power: 11.5 A (VHF); 11 A (UHF)
Receive: 1.2 A (squelched); 1.8 A (max. audio output)
Dimensions (projections not included): 140(W) x 40(H) x 204.5(D) mm, 5.5(W) x 1.6(H) x 8.06 (D) in
Weight: 1.2 kg; 2.6 lb.

TRANSMITTER
Output Power:
VHF: 50 W, 10 W, 5 W selectable
UHF: 35 W, 10 W, 5 W selectable
Modulation System: Variable reactance frequency modulation
Max. Frequency Deviation: ±5.0 kHz
Spurious Emissions: Less than -60 dB
Microphone Impedance: 600 ohms

RECEIVER
Receive System: Double conversion superheterodyne
Intermediate Frequencies:
VHF: 1st 17.2 MHz; 2nd 455 kHz
UHF: 1st 30.85 MHz; 2nd 455 kHz
Sensitivity: Less than 0.16 µV (typical) for 12 dB SINAD
Squelch sensitivity: 0.13 µV (at threshold)
Spurious and Image Rejection Ratio: More than 60 dB
Audio Output Power: More than 2.4 W at 10% distortion with an 8 ohms load.

IC-2350H OPTIONS
INTERNAL UNITS
UT-101 DTMF ENCODER/DECODER UNIT: Enables convenient remote control operation via a DTMF equipped microphone and provides pager and code squelch functions for selective calling.
UT-89 TONE SQUELCH UNIT: Provides pocket beep and tone scan functions and ensures quiet stand-by.

DC POWER SUPPLY AND CABLES

OPC-346 DC POWER CABLE: Same as supplied with the IC-2350H. Cable length: 3 m (9.8 ft); capacity: 20 A.

MICROPHONES
HM-95 DTMF MICROPHONE: Same as supplied with the transceiver.

This one is used but never abused (8+ easy). I bought it new four years ago and it has functioned exceptionally well ever since.

No mods have been applied

Reason for selling. Make room in the truck for the FT-100

$275.00 plus shipping if needed

I have the following manuals forsale. all prices include postage to any
address in the u.s.

1) Original Johnson Viking Valiant operating manual. $40

2) Original Hammarlund HQ-145 tech description and operating manual. $30

3) Original Drake TR-3 instruction manual. $20

4) xerox copy of TR-3 manual. $7

5) xerox copy of Drake R4C (rev. 2) very nice and bounded. $12

6) xerox copy of Drake T4XC very nice and bounded. $12

will sell R4C and T4XC manuals as pair for $20.

7) Original Collins 32S-1 instruction book as new (from surplus sales) $22

8) xerox copy of 32S-1 manual. $7

9)3 xerox copies of the Johnson Ranger 1 (dated 1-55) bounded $12 each

10) xerox copy of National HRO-7 manual. $7

11) original Kenwood TS-930S service manual. $25

12) xerox copy of Johnson Pacemaker operating manual. $10

Ok then, was I fair in my sale? I sold a very clean, perfect working
condition IC-706 in Dayton. Perfect except for the 2 m band being
dead. I priced it $100 under "going price" - $450. I was completely
honest with buyers. Suddenly a guy came along, and it was exactly
what he wanted. I told him "no 2 meters". He said "Why do I want 2
meters. I have 3 of them already." So we hooked it up to a cig
lighter plug, and made a QSO from the flea market on 20 m.
Happy buyer - happy seller.
Then I added another $500 to it and bought a new toy - FT100.
Great times, Dayton !

Consider this as an alternative - Sell the radio to someone who wants
HF only. Drop the price $100 from going rate to, say, $450.
Buy yourself another one at a fest - but check it out first (bring a
cable and cig lighter plug with you.) There are tons of them for
sale, it is probably the most popular ham rig ever.

I did just that with mine at Dayton.

That's about what my Mathcad analysis indicates, based on the power transfer curve I have. Looks like once you go over about 75 to 80 watts you get a lot of IMD products at audio frequencies which causes the splatter you are talking about. I also find it very interesting that Mariage says you can use the 70cm amplifier for ATV use, after a simple modification, up to 82 watts PEP. That's the point where the power curve become very nonlinear. Hum.

> The bias circuit from the Motorola application note AN758 is one

> I am planing to make it to all of them. I wanted to understand the
> issues and try a few approaches before selecting the final approach for
> the others. I have both the Mirage D1010 and the B1016 amps, as well as
> amps by RF Concepts and TE systems.

Do you know anyone who has modified their amplifier? If I was going to do it I would most likely try it out on a used (junk) amplifier to see how well it works. The RF power transistors cost to much to make a mistake on a new amplifier. Modifying a new amplifier would also void the warranty. It would save me a lot of time to use a known good method if you know anybody who has done it for a current amplifier design. One other thing, do you know if there are any manufactures using power MOSFET transistors in their amplifier designs for V/UHF? A RF power MOSFET transistor should not have the base current bias problem because they are a voltage controlled device and would neatly avoid the whole problem. Also the temperature coefficient also avoids the thermal run-a-way problem you could have using active bias with a bipolar transistor design.

> The biggest problem that I have with
> the D1010 that I have involves the mechanical construction. It uses a
> Teflon glass dielectric PCB which is very thin. This is OK, the problem

> transistor leads so the PC board is bent down in the middle to mount the
> RF power transistors. With a epoxy glass PCB this would not be possible
> but with thin Teflon glass it is flexible enough to work but I think it

> is a poor design.

Everything I have read so far states NOT to place any stress on the strip line connections to the transistor! If the tabs on the transistor are pulled up there is the possibility the ceramic case will crack or separate from the mounting base. Plus I have seen comments to the effect, at UHF frequencies, bending the tabs on the transistor may result in a GAIN REDUCTION of 1 to 2 db or more. I am surprised that any commercially manufactured amplifier does this.

> They may have changed the design since mine was made
> more than 10 years ago. The RF Concepts and TE systems designs are more
> recent than the Mirage D1010 which would lead me to one of those brands

I seem to recall hearing about the RF Concept amplifiers where designed by the same person who designed the Mirage line of amplifiers. If that is the case then I would expect both designs to be nearly identical.

> In summary at this time I think the only readily available option is to
> buy an amp made by one of the three and add active bias.

Since the other, the G3SEKs web site, active bias method seems to require only a hand full of parts I think the question should be put to the big three brick amplifier manufactures why they don't update their designs. It can't add more than $20 cost, a drop in the bucket, to a product which already costs $300 to $380 bucks now. They would have a better product and we would have a little less interference on the bands.

Hi Fellas;
I have for SALE:
TenTec Scout 555 with Optional Hand-Mike, Manual and all band modules from 80 to 10 meters and DC cable, all in Excellent Condition.
This Rig has a sticker on the back which has "NB" on it, plus the manual has the Noise Blanker paperwork with it.
Total cost is about $700.00 new!
Price is $450.00 plus a few bucks for shipping.
Thanks es 73....Rich WA2RQY (1961)

169. Which Rotor?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-03 00:00:00 UTC
From: Roger Halstead <rdhalste@tm.net>
Message-ID: <Qb%Z4.13257$LM4.968723@monger.newsread.com>
Source record: 78251

I'm installing a Rohn 45G to 97' with concentric masts, each with its own rotor. The inner mast sets in the rotor in the conventional fashion, although a thrust bearing supports the weight. BTW, I'm using the 4000# Phillistrand guyline at 3 levels..

The next two, which are also supported by thrust bearings, will most likely have to be chain driven. That is dual chain like the primary chain in a motorcycle.

I have one large rotor (One of the old KLMs) that weighs 40# and will certainly handle the torque. Both sides of the top mast clamp come off and I can fit a sprocket to the top of the rotor quite easily as well as to the mast.
I would prefer something a bit smaller though as this thing is big sitting out there on the side. OH! This one will be turning the tri-bander which I hope to replace with a big tribander, although there seem to be few out there now.

I need another rotor to use in the same fashion that will be turning the VHF/UHF array. The problem is that I haven't seen one where I can remove both the top mast clamps. As it only has to turn the VHF/UHF array plus mast which is supported by that thrust bearing it doesn't have to be huge. Mater of fact, I'd be glad to replace the big one with something a little smaller.

These are relatively simple mods, but time consuming even with a machine shop. Even simple projects can be time consuming. It took about $35 worth of metal and close to 10 hours to design (on the fly) a good heavy duty ginpole. (Jinpole?), but it sure works nice.

So, back to the original topic.
IS there, or are there, rotors out there (Possibly several of the Yaesu models) that will lend themselves to this type of conversion?

Any suggestions? and ...No I don't want to turn the entire tower...For one thing I'm already to 40 feet and will be going to 70 via the ginpole with a crane lifting the last 30 feet...While he's here he gets to take down the old 90 foot much smaller steel tower.

186. Re: Mirage V/UHF amplifiers any good on SSB?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-03 00:00:00 UTC
From: arp94539@my-deja.com
Message-ID: <8haecj$47l$1@nnrp1.deja.com>
Source record: 78268

The Mirage, RF Concepts and TE systems amps are all in common use by SSB operators. The audio through them sounds fine, they are not anywhere near as bad as class C amplifiers. The problem is under crowded band conditions such as during a contest the splatter they produce is a problem. Depending how close some one is to you with one of these amplifiers you can hear the splatter 5,10, and even 15 KHz way. The Teletec amplifiers were rumored to use active bias but they are currently not being produced because the factory that made their castings burned and they have not decided to spend the money to retool.

The bias circuit from the Motorola application note AN758 is one approach to a active bias circuit and probably a good one. Before I categorically endorse that basic design I should check the comments on it in "Radio Frequency Transistors : Principles and Practical Applications", by Norm Dye and Helge Granberg. Its disadvantage is it's relatively high complexity it uses a uA723 voltage regulator, external pass transistor, and a the base emitter junction of a second transistor for temperature compensation. That specific design would need a little modification fore use in a 12V amp. The amplifier that it was designed for ran from 50Volts so the base bias current it required was less than .65 amps compared to 1.5 amps for a 160 Watt 13.8V amp. The design on the G3SEK web site used two transistors and a hand-full of passive parts so it is a relatively simple circuit to construct. The bias regulation probably is not as tight though. One key issue with any active bias design is good bypassing to insure that the bias is not effected by the RF present. It is recommended to test the bias circuit driving the base a general purpose power transistor while the circuit is in the presence of RF to check for sensitivity to RF.

I have not made the active bias modification to any of my amplifiers but I am planing to make it to all of them. I wanted to understand the issues and try a few approaches before selecting the final approach for the others. I have both the Mirage D1010 and the B1016 amps, as well as amps by RF Concepts and TE systems. The biggest problem that I have with the D1010 that I have involves the mechanical construction. It uses a Teflon glass dielectric PCB which is very thin. This is OK, the problem is the standoffs that the PC board mounts on are higher than the RF transistor leads so the PC board is bent down in the middle to mount the RF power transistors. With a epoxy glass PCB this would not be possible but with thin Teflon glass it is flexible enough to work but I think it is a poor design. They may have changed the design since mine was made more than 10 years ago. The RF Concepts and TE systems designs are more recent than the Mirage D1010 which would lead me to one of those brands

In summary at this time I think the only readily available option is to
buy an amp made by one of the three and add active bias.

i'm unsure if reaching out to this group is the
right place, but i'm interested in locating one
of those ancient type moblie car "phones" ala
"mannix" or the "honey west" show.

i've been told they were really a radio connect
system into an operator patch to the phone
land lines.

where could i find one of these ? i've looked
on ebay but i really don't even know what one
might be called.

secondly, would it be possible to operate this
type of system now ?

any help to this nutty question appreciated.

thank you.

Source record: 78271

Hey folks!

I am considering buying the IC T81 E (corresponding to IC 81A in the US) handheld.

What is this apparatus like? Is it any good?
Is there any competitor which is better?
How much is it in the US?
Any tests to find on the internet?

I am looking for a handheld with several bands that also could do as a scanner. It would be nice also to be able to attach some kind of external antenna, therefore my new handheld ought to be resonably good at coping with strong signals.

Thankful for any hint!

Regards

Rollie

Cross-band repeat (listen on 2 meters and cross-band transmit on some band higher I.E. 220, 440 900 Mhz) is permitted. One example was given where the user was listening on 440 and cross-band transmitting on 2 meters. The rules in the U.S. do not permit that.

When all else fails, contact the frequency coordinator for your area. They will be glad to help.

Max

Hi Patrick,

I can't really argue with you whether you like a particular rig over another, but your statement that the "Kenwood hears much better if you know anything about receivers" is a little odd to me. Everything I've read pointed to the Icom being a better receiver and most people who responded to my inquiries about the two radios reiterated that point.

I've had the IC-746 for two days, and honestly, from where I sit I'm amazed how well it hears. The dual PBT coupled with the APF (DSP) can pull an incredibly weak sig out of the deepest of mud. I found the Icom to be very competitively priced as well, almost the same as the Kenwood.

A side by side ear comparison of the signal would be interesting, if you or someone here has done it.

73,

John, KB1ENS

Hi, I read that the noise blanker in the 706 and the 706 MKII are adjustable inside the radio. Is the noise blanker in the 706MKIIG also adjustable? If so, how?
Thanks,
Mike

201. Re: Kenwood 570S(G) vs Icom 746 help...

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-03 00:00:00 UTC
From: Gary - KJ6Q <davison7@gte.net>
Message-ID: <Fxa_4.2163$062.78312@dfiatx1-snr1.gtei.net>
Source record: 78283

I have BOTH the IC-746 and the TS-570D (currently at kenwood for upgrade to a D/G). The 570 is currently about $300, or 20% less than the 746 - a significant amount. FOR that $300, you get 6 and 2 meters, with full functionality in regards to FM tone squelch, memories, etc., and a full 100 watts out on ALL bands. As far a receiving ability, and relative performance in weak signal or interference, I rate them both pretty equal, except that the 570's IF shift (in addition to its DSP slope tuning) adds a level of adjustment unmatched by the 746. Put another way, it's not uncommon to pull weak signals thru the garbage with the 570 I can't with the 746. BUT, truth is, I don't enjoy those types of operation enough to necessarily consider that a decision-maker on its own - DXers and contesters might...

I bought the 746 to become my base rig, replacing the 570 in that function (the 570 is intended for mobile/portable use), as well as a TS-780 2/440 multimode I was also using along with an outboard Mirage 1016 150 watt amp I needed for 2 meter operation - so in other words, the SINGLE 746 replaced *3* separate pieces of equipment, and did it well!

As far as I am concerned, the addition of the 2 meter band (I'm not interested in 6 meters), and a few of the additional added bells and whistles provided in the 746 made it a good choice for me - and it meets or exceeds the real-life usefullness and performance of by beloved 570 on the vast majority of counts. If I was ONLY interested in HF, the 570 would easily be my choice and recommendation. If you can spare the extra few hundred dollars, and have use/need for 6 and 2 meters multimode, you will not regret buying the 746 - it too is a GREAT rig!

The ARRL site has PDF copies of the QST reviews for both
radios. If you are an ARRL member, you can access them at:

http://www.arrl.org/members-only/prodrev/bymfg.html

Examining the numbers last fall, I decided that the
Icom-756 (the next model up) was the best radio within
my budget. Then came the 746, followed by the 570.
BUT, I know that numbers can be deceiving.
So I visited R+L Electronics in Hamilton Ohio during
Christmas vacation and had a look.

After trying them out side by side (along with a half
dozen other radios), I concluded that the numbers were
correct. In terms of signal/sound, the 756 was better
than the 746 which in turn was better than the 570.

However, signal and sound are not everything.

After using the rigs, I realized that the display and
control layout on the 756 would never work for me. Too
much squinting.

I settled on the 746 and bought one at Dayton. It will
probably take a year before I know if I made the right
decision.

Read the reviews. Go look at the radios. Ultimately,
you have to live with your decision, so be sure that
YOU are the one making it.

Hello All,

The ALINCO Model DR-599T is a dual band transceiver
offering big value in a small package.
The independent main band and sub-band operation permits
full duplex operation, w/crossband repeat abilities.
offers 30 memory channels (15 per band), high/med/low power,
four scanning functions, full reverse operation at a touch,
priority, call and ABX functions. The 37 selectable sub-audible
encode tone frequencies can be called for encode or
encode/decode (tone squelch CTCSS) decode optional.

Detachable front panel is easy to read and understand.
The LCD lets the operator know at a glance which functions
are in operation. Beep and bell tones can be added or deleted
as desired.

Minor mobile scuffs, face excellent condition. Comes with manual,
power cable and mobile mounting bracket, duplexer,
Air band rx and full 800 Mhz coverage w/ antenna connection.
$265 shipped.

Thanks
AL N4GOD

>How much is it in the US?
>Any tests to find on the internet?

Works great! Receive mod is a software mod. Opening up the transmit involves removing two diodes (at least on the U.S. version that I have). The most difficult part of the mod is removing the nut which holds the antenna onto the body of the radio. After modification, you can even transmit ever so weakly on 220 MHz. I can hit a 220 MHz repeater about a mile from here, although in Europe this is not an issue.

Ergonomically, the worst part of this radio is the idiotic "joystick" control. It's VERY difficult to press this thing correctly to get into the proper programming mode for doing things like PL tones etc.

Make sure to buy the carrying case made by ICOM for this radio. There is a problem with the battery in that the tab which fastens it to the radio cracks off very easily. I use the carrying case to hold my battery onto my radio since the tab on my battery fell off about 6 months ago. I use a MAHA quick charger on the NiMH battery (no NiCad memory!!!!) very successfully.

Performance is very good. 1.2 GHz was implemented very well with RIT control (necessary on this band). 6 meters also works well as does 2 and 440. Although illegal, this radio puts a couple of watts out on the FRS and GMRS channels (I tested this into a dummy load) after modification.

All in all, this is my best handheld. I compare it to a Yaesu 530, Standard 228, ICOM 02AT, ICOM 32AT, and ICOM T8A. The joystick sucks, but the radio is small, the NiMH battery technology is great (since I don't have to worry about the "conditioning" stuff that is endemic to NiCads), and it puts a good signal on the air.

I paid $225 for mine used on the internet. I think that they're about $300 at HRO (www.hamradio.com). Get the soft case (in case the

battery tab breaks off). That's about the only extra accessory you need.

Hope this helps,

Fred KB7UUC

VK - don't know if there are any other regs that effect us in that regard, but I am reasonably careful in my use of the system in such a fashion, about the only reg that I can remember dealing with identifying transmissions states that we have to ID our TX at least once every 10 minutes. There seems to be a little bit of uncertainty as to the legality of crossbanding but a lot of people still do it. As long as you don't interfere with another service or other users then I cannot see any problems with crossbanding. I would welcome an opinion from a Radio Inspector on this question - as far as I can see it is not illegal to do it in VK land but then again there could always be some little regulation that makes it illegal. The main use I have for doing this sort of system is mainly for safety purposes, i.e. if I am bitten by a snake or break a limb when I am out hunting or walking then I would prefer to have such a system in place.

Cheers

Matt

Hi Paul,
I am the owner of a TS-570D(G) and have been quite pleased with it. I have also had the opportunity to use a 746 and, in my opinion, the 746 is much better in receive, especially for CW.
I have not been impressed with the 570 receiver since I got it and after listening to the 746, I can really hear a big difference. Both rigs are nice, but if you have the extra $$, I would go for the 746. If you can get to a amateur radio store, say HRO, where you can compare them side by side, I think you will see (hear) the difference. As a matter of fact, I will be purchasing a 746 in the near future for myself.

Source record: 78337

Hello all,
I have a Kenwood TS-440S HF Transceiver for sale. Working condition is 100%, puts out a full 100 watts on all bands. Mars/Cap Mod has been done. Cosmetically it is good. The top cover has some scratches and marks on the paint and the top of the face is worn. It comes with an instruction manual, hand mic, and power cord. The serial # is 7060100.
Any questions, please email me (remove nospam from email address).
The rig has no additional filters and no internal antenna tuner.
To see pics of the rig go to this link:

http://members.tripod.com/kv16/ts-440s.jpg

Price $400.00 plus shipping from 11710
Thanks for reading,

Source record: 78046

Sounds like perhaps the 'F5' button is bad, as this button controls both the SET and SCP (scope) displays. Probably nothing more than a bad switch or solder joint, but if it's new... back it goes...

- Seth N6BMB

Scott Huber wrote:

Folks,

I own one of these things, and even though it's somewhat obsolete at this point, it is still a very useful VFR navigation tool. The units were selling for $999 to $1099 around five years ago, mostly due to their aviation databases and capabilities. It can communicate GPS data to a laptop computer using some of the pins on the power plug. The Garmin 295 is one of the replacements for that unit. It retails for around $1300.

238. Kenwood th-d7/tm-d700 Euro-model with "SKY COMMAND" mods?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-04 00:00:00 UTC
From: Hugo <pa4la@pi4cc.nl>
Message-ID: <393A5E65.519CE3C8@pi4cc.nl>
Source record: 78154

I can't find any mod for the TH-D7e and TM-D700e, where the "sky command" funtion can be activated with the European settings (repeater shift(s)/1750 hz tone).

I know converting the Euro hardware model to the USA model the "sky command" function works, but there are a few problems when doing that. The info known to me told me that the USA models have a different UHF input filter and uses different frequency's to switching between the input filters,
resulting in low sensitity from 430-435 Mhz when using E-model hardware with A-model firmware.

Is that story thrue and what can be the solution

any info via this newsgroup pse

mny tnks fer info

I have a keypad for the Collins KWM-380 for auction on eBay.

The URL is

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=349728588

and the description is

This is a mint-condition keypad for the Collins KWM-380 HF transceiver. When used with the interface board in your radio, enables direct frequency entry from the keypad, storage of displayed frequency into one of 10 memories, recall of frequencies stored in memory, and "stepping" through the frequencies stored in memory. The stepping feature is especially nice for contesting. This is a heavy metal brute, weighs around two pounds and is mounted on a rubber slab so it stays put on your operating table. Comes with documentation, cable and connector all ready to plug into your '380 and go. This is in like-new condition, owned by a non-smoker who rarely used it. I honestly don't think you could tell it from new. The last time I saw a KWM-380 keypad advertised retail it was close to $300, starting bid is about 1/6 of that; I don't even know if they're still available anywhere else but right here on good ol' eBay.

Closes 6/11/00.

Thank-you

Sent via Deja.com http://www.deja.com/

<Paul> wrote in message
news:39357212.6627541@news.mindspring.com...
: In reply to the CB thread:
:
:
: There is a very old "American Survival Guide" magazine
that deals with
: the topic of CB radio in depth. I think it was either in
'91 or '92, but it
: really got me started "into" radio communication.
:
: A good mobile SSB radio with a 102" whip is excellent for
communication,
: consistently giving more range than the FRS radios. Don't
let the sheeple talk
: you into settling for the FRS radios if you intend more
than keeping in touch
: with your family while shopping at the mall or
Disneyland. I duggest the Texas
: Ranger 696 "F" model mobile am/SSB rig, shown here:
: http://www.texas-ranger.com/tr-696f.html
:
: This is a very solid rig.
:
: Remember, if you get your HAM license, you will be
subject to many
: restrictive operating regulations, and subject to
transmitting your name
: and address identification while operating on the HAM
frequencies.
: Sometimes you may wish to operate discretely, in which
case HAM
: radio would be less than ideal for you. I STRONGLY
suggest purchasing
: the back issue of "American Survival Guide" magazine I
mentioned earlier.
: I believe you will find it quite informative.
:
: Paul

What you should do is check into the NGs Rec.Radio.CB and
Rec.Radio.Amateur.Equipment, with Rec.Radio.Swap as well.

What you are wanting is what is called "outlaw CB". No IDs
but they often use Ham equipment. Not very legal, but then
Survivism is not much for the legal side of life.

However, given the huge amounts of ignorance seen in
misc.survivialism,
getting a Ham license might not be a bad idea. At least
you would
learn something about communication techniques and
technology.
Even Hams have dual "personalities" were they are legal as
Hams
but operate as outlaws in the bands outside CB and Ham.

And if you look at Bosnia, many of the folks there are
using ham
equipment. It is the most affordable, for the power,
telecommunications
equipment out there.

>
> John KA1HIC

I'm just guessing , but I would think it's probably ok. Maybe common mode currents on the feedline upsetting the accuracy of the meters, and the rig thinks it's a bad match and shuts down. If the rig "thinks" it's a bad match for whatever reason, maybe a loading condition it wouldn't like, it probably IS bad . Or at least as the finals are concerned. You don't mention ant, freq, etc, so hard to say. But sounds fairly normal. I've seen them do that before, and I knew the rigs/tuner were ok. MK

Yep:

I have found a few more of these Motorola RLN4008B series Programming
Rib Boxes.

These are the "Real MaCoy" and Not a Home-Made or Clone that sometimes
can and does corrupt Mototola High-End portables and Mobiles. They also
support a Dual Power Support Feature as Required in the RSS Manuel for
proper protection against Code Plug Corruptions.

I am offering the Rib Boxes by themselves or as a lot.

$165.00+$8.00 For the Rib Box
$ 29.50 For The Rib To Computer Cable
$ 22.00 For the Factroy Power Supply (or I can give a sub for 10.00)
$ 2.99 for the Duracell battery

Or you can have everything listed above and in to photo
for

http://www2.4dcomm.com/metrotech/mrbox.jpg

$195.00+$8.00 for shipping and handling

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate
shipping is desired) or a Personal / Business check is A-OK too if you do not
mind a Short Shipping Delay due to bank processing time. This is required only
the first time or two as once you are in the data base, PrePayment is no longer
required

Source record: 78178

I need to know if this is a good radio. I am about to upgrade from tech, and have a friend that is selling this radio and an assortment of antennas. I trust and respect the seller very much, but not knowing a whole lot about HF equipment, I thought I'd come here to get an idea of what I can expect from this rig. What would be a decent asking price, etc:? Will I need to look for anything else to go along with it (antenna tuner, etc)? Are there any documented problems with this model? I plan to use it to monitor and practice copying code until I finish my upgrade. Any info on this rig (that includes opinions, biased or otherwise) will be greatly appreciated.

Thanks in advance,

John

Date: 2000-06-04 00:00:00 UTC
From: Chuck Bennett <ka6uup@pacbell.net>
Message-ID: <393AF1E8.85971D3C@pacbell.net>
Source record: 78191

I have a HRO500 which is cosmetically a 9/10 It suffers from having been
in storage to long and is now inoperative.
The bandspread/preselector dial is warped and will need to be
fixed/replaced.
It is complete and comes with an origional manual
asking $300.00 OBO
Prefer Pickup
73,
Chuck Bennett

276. FS SP600VLF

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-04 00:00:00 UTC
From: Chuck Bennett <ka6uup@pacbell.net>
Message-ID: <393AF210.ECEE0761@pacbell.net>
Source record: 78192

I have a SP600VLF which has been thru a depot reconditioning.
No black beauties, and the front panel was repainted and relettered.
It is intermittant on one band. I suspect a cold solder joint or a cap
as sometimes it is ok and othertimes it is dead.
I will include a manual copy
$650.00 firm
Prefer pickup
73,
Chuck Bennett

277. IC3AT Schematic / For the folks wanting the 22s Schem and Manual

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-04 00:00:00 UTC
From: Bill Gallagher <KS3Y@prodigy.net>
Message-ID: <8hesm6$3l24$1@newssvr03-int.news.prodigy.com>
Source record: 78193

Hello, All!

I'm looking for an IC3AT schematic, if anyone has one!

For those of you who were looking for the IC22S schematic and manual, I have posted them into a directory on my website (right click, and select 'save target as').

The Manual is in Adobe PDF format, so you'll need to download the viewer (free) if you don't have it.

The schematic is in BMP format.

http://www.geocities.com/ks3y/icom22s

278. KNWD 570 Battery?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-04 00:00:00 UTC
From: lstolz@gcfn.org
Message-ID: <8hf122kc1@acme.gcfn.org>
Source record: 78194

Two questions:
1. Where is the Lithium battery located on the TS-570?
2. What is the model/type and is it snap-in or solder-in?
Thanks,
Lynn

279. Re: Icom 746 no SET menu Help Please

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-04 00:00:00 UTC
From: John Wagner <john@neknetwork.com>
Message-ID: <393B124D.A91BAEF8@neknetwork.com>
Source record: 78195

I'll try to help, maybe just confirm that it's broke, dunno...

When you say the set menu will not display, do you mean you push F5 and
it just doesn't switch to the set menu? If that's the case, I wonder if
your F5 key is toast, as that's the same key that starts the scope.
Also, on menu 1, push Key, then try F5 (set) on that menu. If it doesn't
work, I'll bet that's what it is.

Bummer!!! I would imagine getting a new radio home and having it not
work would be a major disappointment. Hope you make out OK on it. 73,

John, KB1ENS

Source record: 78227

Shack Cleaning List 6/3/00

All items are as is. Items will be listed as working or not. Prefer payment to be US Postal, Bank or International Money Orders, checks are ok, but will hold up shipping until they clear the bank. Shipping is additional. Digital pictures can be supplied for most items. On with the list.......

National SW-3 using the 32 and 33 tubes....this rig is clean and works well. It does have a few items to note....a "bird brain" put a heaphone jack in the lower right corner of the rig (removed now). I carefully filled it and texture painted the patch job, which matches the original black texture paint very well....The repair job is virtually not visible as pictures show. One of the coil sockets was cracked...just a bit and was repaired. An original National coil set for 80 meters is included with the rig. Also, I believe I have 4 empty coil forms, maybe 6..... made by a fellow in IN...that will go with the set for your winding pleasure. These are very nice quality coil forms. This is really a neat radio. The best regen out there....(my opinion) Unfortunately the doghouse power supply does not come with the set. I used it with a little hombrew power supply that I wish to keep. Selling Price for the above $350 Prefer pickup, but will ship. OFFERS??

AEA CP1....RTTY demodulator terminal unit. Not sure if it works, it was used with a C-64 on RTTY. It is clean and unfortunately I dont have the manual for it. Price: $25

SBE-34....This is a compact travel transciever, solid state, except for the driver and finals. It works, but could use an alignment. The service manual an operating manual come with the rig....The original SBE mic does too...this rig also has a Collins 2.1khz filter in it as originally supplied. The radio is clean and in good condition...it does not appear to have been in a smoking enviroment....I dont smoke...so none of these rigs have been exposed while they have been staying here in the shack :-) This rig is also capable of 12 VDC operation, though I have not tested that feature. Price: $175

Morrow Twins with Homebrew Supply......The MB-560A and the MBR-5. The two rigs are joined together (by their feet), but can easily be separated. They work well and the supply easily powers them....it is a beast....hi A manual copy comes with the setup. I prefer pick up on this item, unless the Power supply is not wanted. Power supply is not shippable. Price either way is $325

Heath HG-10 VFO....Good condition, but could use a bit of tlc. I have never used this. It was purchased as a spare that was never needed....Price: $50

Harvey Wells "Z Match" ....this has a stock wattmeter/swr meter in it....nice condition. No manual. A rare unit. All original. Price: $165

Yaesu FRG-7 Shortwave Receiver....This unit has many of the "Gilfer" mods. Works ok but, could use a fresh alignment. (Can be tricky to lock the mhz, but it does lock.) Rig is clean and has great audio and accuracy. Manual comes with unit. "D" internal battery tray is NOT in the radio. Price: $175

Hallicrafters S-38.....Rough condition, rusty on the inside, but with "tlc" could be brought back, not working, but original right down to all of the capacitors from what I can see. Missing bottom cover, was cardboard I believe? Price $35

Heath HD-1418 Audio Filter, brown series....works ok , but speaker output low. Good condition. Comes with original manual. Price: $40

Drake Theta RTTY Terminal unit, Mint condx stand alone unit with a B/W monitor. Original manual. $215

Universal M-900 Shortwave Decoder with B/W monitor. All in excellent condition. With manual. This is a stand alone unit....no other computer needed $300

Heath SW-717 Shortwave Receiver.....excellent condition $135

Kenwood AT-200 Antenna Tuner good condition, manual included $150

Lampkin Freq Meter good condition, no book $35

More to follow.....

Likely that would be too low a price for the 706MkIIG .. which is the
latest in the series.

Likely it is still on Warranty .. so it should go to Icom (likely he
will be waiting a while, though!).

Phil

I have both. the VX-5R is by far the better rig, IMHO.

Mine failed when it was a few months old (TX stopped working).. so I
took it to Yaesu (40 min drive) and they fixed it. It was an early run
modle but had none of the normal problems.

319. Revamping PK232 vs. using PC sound card.

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-05 00:00:00 UTC
From: "Dennis J. Ciurej" <dciurej@worldnet.att.net>
Message-ID: <IJD_4.3517$2b4.256852@bgtnsc06-news.ops.worldnet.att.net>
Source record: 78070

Need opinions guys.

I've got an old PK232 that-s pre MBX and pre just about everything.
Timewave is selling a new DSP upgrade and it, plus PK Term (to replace my
old DOS program) will set me back about $200.

But it won't run PSK31.

I've been hearing about how a lot of this stuff (including PSK31) can be run
off of a sound card, with the correct software, and I see that there's a new
interface for fumble fingers like me that will do all of the correct
connections from my old Kenwood 440 to the sound card for about 80 bucks.

So, for all you digital mavens out there, is it better to use the sound card
for RTTY, AMTOR, Packet and PSK31 (and what are the programs that I need?)
or should I fork over two C notes for my PK232 upgrade?

Greetings.
I am looking at a 850sat. I was out of hf for quite a while, so not familiar with this rig. Had a 440sat when I went off the air, so have not heard gud or bad about 850. Serial #'s to watch for? Hows the receive? What scope matches and is it easy to hook up? Any thoughts would be appreciated.

Hi,

I picked up a Sears 41238800700 VHF/FM 2meter rig at the Atlanta hamfest on June 3. I need to know if anyone has a schematic and/or wiring for the microphone.

The attenance at the fest was a little low, and not very many vendors. I also picked up a 73's mag from June '79 and the editoral from Wayne Green spoke a bit about the Atlanta fest during '79. He stated that the Atlanta fest was going to put Dalton out of business.

I guess everyone is on ebay now so fest are going to become obsolete?

Thanks,

Thanks

I'm interested in the 30L1, but I'd fly to pick it up in person...Cash!
If you are within 80-1200 miles of central Michigan.

The only way I purchase these kinds of items on the net is to see them and
pay cash in person.

I do not in any way shape of form buy though e-bay.

Another reason to get a ham license:
It wouldn't surprise me to soon see scanners outlawed. However
In a fit of wisdom congress made a law that said ham operators
could have receivers that would receive law enforcement signals......
nuff said....

WoW. I wish your EOC was my EOC director. My county won't spend anything on improving or repairing ARES/RACES gear.. But they sure like to call on us for those nuke plant drills and bad weather.

I guess that is why our members are dwindling.. Only folks left are what I call the "walking wounded". Retired, disabled, or like me, too stupid to realize the county and FEMA don't give a sh*t. Plenty of lip service, plenty of BS, no resources. BTW has nothing to do with the county having high tech resources.. all it takes is one car accident into the "right" telephone pole to take out the entire fire communications system.

When we die off , move, or find something better to do at least EOC will still have their cellphones to handle emergencies.

this is what the FCC said about scanners:

FCC PREEMPTS SCANNER LAWS
FOR HAMS

The FCC has ruled that states and municipalities may not
enact ordinances forbidding amateur radio equipment (mobile
scanners) simply because it receives frequencies normally
reserved for police use.
Conclusion: We (the FCC) hold that state and local
laws, that preclude the possession in vehicles or elsewhere of
amateur radio service transceivers by amateur operators merely
on the basic that the special emergency, or other radio service
frequencies, the reception of which is not prohibited by federal
law are inconsistent with the federal objectives of facilitating
and promoting the amateur radio service and, more fundamentally,
with the federal interest in amateur operator s being able to
transmit and receive on authorized amateur service frequencies.
We therefore hold that such state and local laws are preempted
by federal law.
The FCC s ruling follows a five year effort by ARRL to
obtain a definitive ruling after several highly publicized cases
where Amateur Radio operators ere subject to arrest and seizure
of mobile amateur radio equipment by local authorities for
violation of so-called scanner laws

I found a crystal in my parts bin marked as follows:

Yaesu
FT-200
35.500

Obviously, it's a Yaesu FT-200 / Tempo One crystal
that runs at 35.500 MHz. What band does it cover
when installed in the set?

Hi there.
Looking for the following old electronic musical gear from 1950-1990,
BROKEN OK:

Synthesizers (MOOG, ARP, Oberheim, Sequential, Roland, Korg, etc)
Keyboards
Drum Machines
Effects
Sequencers
MIDI modules
vocoders
Any old patchable modular or analog synth

Roland TB-303 Bassline
MC-202 Microcomposer
TR-909 Rhythm Composer
TR-808 Rhythm Composer

If you have something I might be interested in or know someone who might,
please email me with price and condition as well as phone number if you'd
like. Thanks in advance.

For example but not limited to:Oberheim Xpander
Pearl SY-1 Syncussion electronic drum module
Simmons SDS V electro drum brain
Simmons SDS7 Digital-Analog Drum System (brain only)
Roland MC-202 Microcomposer
Moog 16 Channel Vocorder
Roland Jupiter 8
Roland TR-808 Rhythm Composer
etc!

It's not true everywhere. The fire chief of a neighboring community (Northbrook, IL) was in Florida when hurricane Andrew blew through. He saw there how hams were the only ones who were able to communicate after the storm. After he moved here, he had hams added to the village's emergency plan. We have a radio room in the EOC and the fire dept. has purchased tens of thousands of dollars of ham and emergency equipment (antannas, generators, portable radios, etc.).

345. F.S. GAP Challenger DX Vertical

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-05 00:00:00 UTC
From: Alan Gray <W3BV@arrl.net>
Message-ID: <393BD3D3.7004E411@arrl.net>
Source record: 78096
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For Sale: GAP Challenger DX Vertical 8 Band Vertical Antenna. Brand new and unused in factory carton. $200, F.O.B. Zip Code 18910

Alan, W3BV

Description from GAP Web Site:

CHALLENGER DX

8 Band Multiband DX Antenna

Bands: 80m 40m 20m 15m 12m 10m 6m 2m

Bandwidth: Under 2:1 Entire band on 40m 20m 15m 12m 10m 6m 2m; 80m over 130 KHz; 10m over 1MHz

Height -- 31.5 ft.

Weight -- 18 lbs.

Radiation Efficiency : Exceed conventional verticals by up to 600%

Mount : Ground or elevated. A ground mount is supplied.

Counterpoise : 3 at 25 ft.

Ground Area Required : Fits in 10 ft. by 12 ft. area.

The Challenger antenna is the first production multiband antenna to utilize GAP technology. Thousands of Challengers are now in use throughout the world. From the jungle of New Guinea to the bitter cold of Finland to the brutal sands of Desert Storm, Challenger with its elevated feed links its user with rest of the world. Challenger is the first and only antenna capable of operating on eight separate bands from 3.5 MHz to 144 MHz. Its operating bands are 80m, 40m, 20m, 15m, 12m, 10m, 6m, and 2m. Over 130 KHz of bandwidth is provided on 80m. On 2m Challenger is a great base station antenna.

CQ tested the Challenger and established that on 2m, for example, its gain was approximately 6 to 8dB. On 40m compared to a mono band vertical, they found Challenger an S unit stronger. This is typical of the many reports received from amateurs around the world. Challenger is designed to be mounted directly in the ground or elevated. A ground mount is provided with each antenna. With the ground mount in place, the Challenger simply drops in. If necessary, because of space limitations, but not to improve performance, Challenger may be roof mounted since it does not require earth loss to obtain a 50 ohm match.

Challenger requires a counter poise of three 25ft. insulated wires. They may be buried or just scattered on the ground. Symmetrical deployment is no critical. Adding additional wire will not significantly improve performance. All of these are covered in a 16-page assembly manual provided with each antenna.

Thank you to all who responded with donations for the Society's tables.
All went well with one exception.

Towards the end of Saturday someone decided they needed my HT (a Yaesu
FT-530 in a black soft pouch) more than I did. Besides being without the
HT, and having no venue to relieve my anger, I feel as if a member of my
family has been kidnapped. :-] I loved that radio!

Not that I have any serious hopes of ever seeing the radio again, but if
anyone could shed light on it's where abouts I would be grateful!

Thank you.

Louis

Micor 2m conversion repeater
model 893RCB-3145B-RH52,
on 146.700/146.100,
100w solid state final,
new helical RCV filter installed/tuned,
with full duty power supply,
installed in cabinet,
with service manual.
Scom 7k controller w/ all options, (PL & patch),
recently sent in for latest firmware upgrade,
with user manual and windows software.
new price $900
Telewave duplexers, NEVER BEEN USED - NEW!
tuned for above frequencies,
model TPRD1556.
new price $1572

Total replacement cost is about $3972 - asking $2000 + ship
Serious inquiries ONLY

You must remove both the top and bottom covers. Remove 2 screws on the front and loosen the other two and fold down the face. You will see the battery that pops out easily. It is avail. at Radio Shack. CR-2032

361. ?? IC756 Software question????

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-05 00:00:00 UTC
From: KC0AK <alexjent@prodigy.net>
Message-ID: <8hh4bp$34g2$1@newssvr03-int.news.prodigy.com>
Source record: 78112

I now own a IC756 (non-pro). I understand software is available for it somewhere.

Question is: I buying the interface worth buying??? What can one do with such software?

Or if someone can point me to some URL or something that describes what can be done with such software I'd be grateful.

I don't want to buy the interface just to find out!

The same thing here in Midland County Michigan.
The hams get called up for just about every general emergency, from flods,
chemical spills, and "weather" (we get tornadoes and sever thunderstorms in
the summer and the occasional blizzard in the winter)

> > We also are a key part of a program that will lower property

We have a radio station set up right in the EOC along with the 911 operators
and central dispatch.

There is both a 2 and 440 rig along with packet and probably before long
APRS.

I am having a problem with my HD73 rotator. The meter seems to 'have
too much gain'. By that I mean it pegs before the rotator even reachs
the half way point.

Does anybody have a schematic they could email me, or know of a web site
with one?

THanks,
Tracy

We don't have nuke plants nearby, though we will be doing some hazmat drills along those lines.
They ship N-waste and fuel up and down I-69.
As for bad weather, who needs drills :) We get plenty real stuff!
It's been at least once a week lately. EC indiana isn't widely known as tornado alley, but we get the highest frequency of F4-F5 in the country. Oklahoma and such get the most of the F1-F2s.

> I guess that is why our members are dwindling.. Only folks left are

> fire communications system.

When we were going into Y2K, Bill had us set up and be available for backup to the 800 MHz system.
We didn't need to take anyone off parties and such, but we had plenty commitments for no alcohol, and have radio on hand. He fully realizes that it's a system that's great when it works, and when it's down, it's useless.
Our stormchase team has CB and 800 at the moment, (800 is useless out of county) but we are training them up for ham tickets, especially the leader, a phD meteo.

> When we die off , move, or find something better to do at least EOC
> will still have their cellphones to handle emergencies.

ROTFLMAO

I was just out on a skywarn run last week, we had a downburst that sent a bunch of trees down in one neighborhood. I was out of the car, so I tried to call in on cell, and as it turned out, the same little storm killed eight cell towers. No coverage.. Had to come back to the car and use good old ham radio again.

We haven't seen any capacity jamming here lately, but it's almost
certain to happen in any real incident.

Source record: 78118

My selling price survey of Tek stuff on eBay has been updated. The
survey
now includes 963 different instruments (scopes, probes, plug-ins etc),
and
there are over 9600 prices data entries gathered during the past 10
months.
Some HP, GR and Wavetek stuff too.

My site is located at :

http://www.vaxxine.com/phil/default.htm

Still haven't got any pics in the "scope" section yet but there are few
in the
Vintage Radio section (this takes WAY more time than I thought it
would).
Comments/suggestions on the format greatly appreciated.

Phil Turcotte (VA3UX)

> There is both a 2 and 440 rig along with packet and probably before
> long APRS.

I am working with Steve Bragg on a "skywarn" version of the HamHud
for APRS.
http://www.c2-tech.com/~steveb/hamhud/
The idea is to let you enter messages with the "whiz wheel" like:

Tornado at 2 miles NE moving 20 mph E
or
Hail here size quarter

This is in a "fill in the blank" format. It calculates positions
relative to your current position.
Other Hamhud units will hear these messages and interpret, so that
tornado might display on my HH as:

Tornado at 5 miles S moving 20 mph NE

along with a beeping alert for tornado, wall cloud, and large hail.

The idea is that the user dosen't have to interpret, it's all
relative to your current position.

It runs "smart beacons" which make it dramatically easier to track
mobiles than the original fixed interval beacons.
It beacons whenever there is a significant change in your course, so
every corner gets "pegged", but when you are stopped, or cruising
straightline, it only beacons at a slower rate just to keep track.
(the web page has better descriptions)

We run APRS, and SSTV, along with VHF voice for the main net, and UHF
for tactical.
Three SSTV mobiles now, on 146.565 with Chromapix at the EOC.
HF capability also, but I don't see a lot of call for that in
localized events.
Our VHF "reach" is about 100 miles, anything that big, then I guess
we heat up the HF gear :)

Hello Dean,
The 35.500 Crystal is for the 21.000 to 21.500 MHz band. it is designated X202 in the heterodyne crystal oscillator (TR201 2SC372) It should have been fitted as a standard item.
According to the Instruction Manual for the Tempo One (FT200), 28.5 to 29.0 MHz is crystalled as a standard band. And optional crystals can be installed for 28.0 to 28.5, 29.0 to 29.5, 29.5 to 30.0, for which HC16U crystals with wire leads are recommended and should be soldered into marked positions on the Heterodyne Oscillator circuit board. The appropriate Trimmers should be adjusted for each added crystal.
Hope this helps, 73 de Denzil G3KXF.

375. Equipment Panel Labeling Advice/Questions

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-05 00:00:00 UTC
From: Jim Flanagan <jflan@ieee.org>
Message-ID: <MPG.13a6033efcb47bff9896ed@netnews.worldnet.att.net>
Source record: 78126

Hello..
I am looking for advice on panel labeling. I have seen threads
regarding this topic where the use of decals, thermal labeling devices,
etc. have been used, but I want to learn an easy to do 'paint' technique.

I understand that silkscreening is what is commercially done, but are
there alternative ways that one could do this? As far as silkscreening,
what is the cost of having a stencil made, assuming that I provided the
artwork in negative/positve form? That seems to be where all of the cost

is tied up.. Thanks for all responses...

Source record: 78128

I just finished doing a side-by-side of my 570DG and 746 and echo everything Gary says below. this is the best review of the two I have heard yet. My bottom line: they both hear the same. The 746 is a bit clearer tone on SSB RX, but not as flexible on the DSP functions. The 570DG has more options to filter TX audio - the 746 is only a treble/bass sort of scale. The 570 can connect directly to a computer without the $100+ interface. The 570DG is a good size for mobiling, especially if you don't want to go "micro". I have had great audio reports on both. I am keeping the 746 for the extra bands and cause we all need new toys on a regular basis - as boys will be boys.

Source record: 78131

Gary; Would you be able to help me with a coupkle of questions from the IC-970 manual pertaining to the receiver alignment?

1. Page 4-8 Total Gain (Main-Band)/(Sub Band).

Both the procedures for the main and sub band Total Gain instruct one to insert an unmodulated carrier frequency and make reference the displayed frequency as being 145.0000 MHz. The Mode is to be set to USB. Then you are instructed to adjust the AF (volume) control followed by an adjustment of R149 or R247 to attain a 20 db S/N level (generator on vs off).

If you follow these instructions there is no audio to measure because you are zero beated! Conversely, I note that the IC275 manual instructs you to first adjust the tuning control for max audio output which makes better sense.

2. Page 4-8 Total Gain (Main-Band)/(Sub Band).

The IC970A manual denotes an astrisk near the generator level with the cooresponding notation that the signal generator (SSG) is set to the indicated level as the SSG's open circuit. The manual for the IC 275 makes no such reference.

If I recall, in the (very) old days, some generators were initially adjusted into an open circuit to a level 6 dB above the desired terminated signal level. Modern procedures make no such reference and assume the generator is terminated into 50 ohms. What is the proper course of action here? Do I simply set the generator up terminated into the receiver and adjust the signal level to the prescribed level in the manual, as is apparently the case for the IC275? Or do I have to assume that the proper level is 6 dB below the prescribed level??

3.
What is the part number and value of the famous plastic variable capacitor that might fail in my radios so that I may stock up on some ceramic replacements? By the way my garage door opener in my car just failed due to one of those!

Thanks!

Chris:

The FT-127RA uses the same microphones as the FT-227RA and FT-227RB 2meter versions of the radio (the RB had slightly different memory capabilities for more repeaters versus simplex). I don't recall a 127RB only the RA model. I still use my 227RB on the desk and smaller ICOM 2100H 50 watt rig in the car. I still like the audio of the 227RB. Good reliable rig except for the relay which occasionally sticks and needs to be cleaned once in a while. BTW anyone on the newsgroup have a PERMANENT fix for that?

As far as microphones for that rig, you have two choices, they are:

YM-22 16 button (1-0, *,#, A, B, C, D) DTM|F TTP on front, UP/DOWN freq./scanning buttons on top, condenser Mic 600 ohm.

or the:

YE-17 (no TTP) UP/DOWN freq./scanning buttons on top corner, dynamic mic 600 ohm.

Note that these are completely different connectors than the earlier FT-227R used.

I believe that Yaesu can provide a new comparable microphone wired with the correct mic plug for a nominal additional charge if you want a ready made plug and play approach, otherwise roll your own with a soldering iron and schematic. If you need one for the rig I can't help you as I've only got the 2 meter cousin of your rig. They are probably very similar if not exactly, as far as the mic circuit, but it'd better to get a copy of the right one.

Hope this helps. Happy Hamming and Good luck !!

73,

Gary N7ARE

Do any of you good people know how to figure dealer cost on new radios?
How do you get the best price?...Not at hamfest this year! Can we get
radios from Canada? Are there any good "buys" now? Should I wait until
next year after the new hams have bought their rigs this year?

Not at all uncommon, if you are using Heliax.
The center is a tube. If you have a bad connector, or none, on each end you could use it for a hose, but that won't hurt the coax..

Cut maybe an inch off the end of the ocax to check for corosion on the outside of the inner connector, and check the condition of the shield. If both are clean...then use one of those little tube cleaning brushes to clean out the inside of the center conductor before screwing in the center pin for the connector. (makes its own threads)

The stuff you don't want water any where near and take special precautions on the connectors is 9913, or equivelant. I've had water get in it and had to throw the entire length away. I'd rather spend a bit extra for semi rigid stuff that I don't have to mess with, whether Heliax or the Time Wire Stuff which I can't remember the name of.

> I had been sitting for seven years, in the secure secret eoc station,
> unterminated, and getting water from above.
> It's a pretty long bit up to the roof, 3 story building, and we're in
> the basement.

Blow it out, check it out and it's *probably* OK, *IF* it's Heliax.

What I really don't like about the semi rigid stuff is the cost of the
connectors. which run from around $35 to $75, or $80 each.

Sounds like the stuff. Andrews something or other. Spiralled
insulator.

We lucked out, our local microwave specialist had several of the
right ends in his junk box.
I picked up some more at a hamfest for $15 each.

Kenwood TS-850SAT for sale.
It is in excellent condition both physically and electrically.
50 mil. serial number.
Clean in every way and works great. No scratch or ding.
It comes with MC-60 desk microphone but no hand mic, boxes, or filters.
It also comes with original manual.
Reason for selling is that I decided to stick with older radios that I
have and I don't use it much these days due to family matter.
Price is $825 (in USD) plus actual shipping cost by UPS (around $35 for
most locations).

Thomas, if you have a Tone Squelch on that unit, be sure that it has not been activated...That will keep you from receiving anything until a tone is sent to open the squelch...
I am not familiar with that radio but that would be worth a try.

I attended the Breezeshooters hamfest in Butler, PA last Sunday. In the past 11 years, the flea market contained some excellent bargains. This year, I noticed that prices in the flea market almost exactly matched the prices I see on the internet. Internet prices used to be much higher than hamfest prices. I wonder if the net is now serving as the "new book value" for those wanting to sell their items. Has anyone else noticed this trend at other hamfests?
Please reply DIRECT by removing the words "nospam" from my address

> This is in a "fill in the blank" format. It calculates positions
> relative to your current position.

I do like this...but as far as entering inforrmation from the field I'd much rather use voice as no way can I take my eyes off the road in some situations...The ones where you have one on the road, one looking for a hole to crawl into, and one on the sky.

About three years ago, I got caught trying to beat a storm. I was crossing North to Sough, trying to get a look at the south and back side when it dumped on me. I had about 5 miles where I could barely see the end of the hood along with extreme lightening.

About the time I started to see a bit farther and it was getting a bit lighter...and the hail started. Not the little pea, or dime size, but quarter to golf ball size. I made the corner and was able to see much of the sought side of the storm. The hail was so bad (made so much noise hitting the roof) that the EOC had to keep asking my location. They finally got it and said "we just received a report of baseball size hail on that corner". I replied that the largest I'd seen was golf ball size with the most being quarter. And...I was out of there. I didn't even care if it was a rumor, I was headed for safer ground. <:-))

Had we had ARPS one transmission would have told them right where I was.

The biggest drawback is trying to read the screen and/or entering any kind of data has to take your attention away from driving and away from the storm.

With large hail, lightening, and tornadoes you can't afford to look away (safely). working as a team, or pair is much safer, but storms pop up so quickly that it's either take cover, or grab the camera and go hunting.

> (the web page has better descriptions)

What's it do with foot to the floor acelleration<:-))

Like the Transponder in aircraft you need an ident button on the rig and the ability to interrogate from the EOC, which you probably do.

>
> We run APRS, and SSTV, along with VHF voice for the main net, and UHF
> for tactical.

We also have subscriptions to real time RADAR so the images can be sent to all concerned (that have the equipment) "with permission"

> Our VHF "reach" is about 100 miles, anything that big, then I guess
> we heat up the HF gear :)

We cover 30-40 miles locally, but are tied into two other systems so that our information can cover two thirds of the Lower peninsula...I've never seen an instance where we need that kind of coverage, but it is available.

We are adding link receivers so we should eventually get HT coverage for about a 30 mile radius.
>
You probably won't be able to hear anything on the HF gear any way if the lightening is intense.

many years ago...Prior to 1980, I was on a weater net on 75 meters. All of a suddent the only thing I could hear was steady static with the S-meter pegged.

My son and I went upstairs and out the front door. We could hear a very loud roar. I looked straight up into the bottom of one about (what appeared to be maybe 300 yeards up. It continued about a mile and a half north (over the village of Breckenridge) and then touched down in a corn field. 25 miles later it hit a trailer park in the outskirts of Midland. They had evacuated when I reported it on 75.

It was not a large tornado, but it sure made a mess out of that trailer park.

400. Re: HD-73 Questions

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-06 00:00:00 UTC
From: Gary Zabriskie <garyz@xmission.com>
Message-ID: <8hi442$58l$1@news.xmission.com>
Source record: 78000

I recall having had this exact problem years ago and the fix was relatively minor, just replacing some resistors that were fried. I sold my HD73 after I took my tower down 15 years ago so my memory is vague. Good luck getting it going around again. It is a reparable problem that was common to the HD73, I recall.

73,

401. looking for bicycle mount for radio

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-06 00:00:00 UTC
From: Jim Ek <JIM-EK@worldnet.att.net>
Message-ID: <S_0%4.1207$fy.67662@bgtnsc05-news.ops.worldnet.att.net>
Source record: 78001

Looking for a mount for Handheld to bicycle bars. This is actually a recumbent bicycle and does not have the normal 'stem' setup (so primarily only have the horizontal bar to use).

If you know of a place that sells such a mount, would appreciate the URL.

Thanks much,
Jim Ek - KB9VEZ

403. For Sale: Comet 10/6M vert Ant

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-06 00:00:00 UTC
From: Howard Rudy <hrudy@lgcy.com>
Message-ID: <393D6477.11B53B13@lgcy.com>
Source record: 78003

I thought that I had all my Ants sold with my last post.
But the Ham that wanted the 10/6 m vert. never sent the
money order, nor will he answer my email. Had a lot
of later replies from Hams that want the Ant too, but
didn't keep there replies.
So the Ant is up for sale again.

"New In Box" NCG Comet Antenna #CA-350DB 10/6 m dual band vert.
10m 2.15db gain & 6m 6.5db gain; 22.6 ft long 6.4lbs.
new price $259.95 from AES asking $125.00 + shipping in the USA.

I've noticed the same thing and was also at Breezeshooters. I did see more HF radios than in previous years and none were what I'd classify as a bargain. eBay and the like must be having the exact effect you stated, which is too bad for those of us who look forward to a bargain once in a while at a hamfest.

Steve

> and central dispatch.

We are not allowed in the 911 center for "security" reasons (go figure). 911 Center is in a phone company building. We got an antenna to them to install but it never was installed. Probably still laying in a box. We have two ancient 2 meter radios, one HF, one old KPC-3, one old 386 and one donated PS2 486 with a 14.4kbps modem. I donated the 386 and the modem. Two of the antennas at eoc have bad coax that we can't replace ourselves and building maint won't change out because of building construction. The generators for the building flood out with water from a local creek during heavy rains. exhaust fumes creep into the radio room. The room leaks water and plastic tarps have to be placed on all equipment.

Hi All

Just to let you know that VK Classifieds & VK's on the Internet have had a name change. They can now both be found at:

http://www.vk2ca.com

This was due to an upgrade in callsign from VK2NNN to VK2CA....so the Domain Name had to change also (not that I minded!)

Please adjust your links or advise sites that are using the old vk2nnn.com links. Thanks.

Source record: 78011

Hello,

I have an almost new out of the box Yaesu VX-5R Tri-Band Handheld. This rig was purchased last winter and is perfect. The box is absoluetly mint - not a mark, dent, bend in it. The manual look as though it was never opened. And the rig comes with the original warrant card, Circuit Diagram, all plastic wraps, boxes, wall charger, and Yaesu sticker. I also purchased a Cig Adapter(E-DC-5) for the unit that will charge the radio while mobile. You will be unpacking as close to a new Yaesu VX-5R that I can imagine!

In a nut shell if you are looking for a new Yaesu VX-5R, minus a few hours playing with it(I just had to get one!) this is the rig you are looking for...

I am the original owner and hate to let this handheld go, its just the perfect handheld in my opinion. I am saving funds for my dream rig - Yaesu FT-1000MP =)

$275.00 shipped Cont. US

Thanks all and someone is going to get a heck of a nice Yaesu VX-5R!

The following is a repeat of an ad I ran earlier. I apologize but had a buyer "vanish" on me:

Just acquired an Icom 746 so have no need for my HTX-10 purchased in January, 2000. Rig was never used mobile and saw very little use in the house (just got around to putting up an antenna about two weeks ago.) The HTX-10 is a 25 watt 10 Meter mobile radio. The radio is in like-new condition. It has no dings, dents or scratches. It has been in a smoke free environment.

The radio will come in it's original box with original manual, etc. I even have an extra power connector I bought from Radio Shack which I'll throw in. If you have any questions please email me at:

BillBischoff@nettally.com

$110 SHIPPED!

> heavy rains. exhaust fumes creep into the radio room. The room
> leaks water and plastic tarps have to be placed on all equipment.

OUCH! At least you don't have rats, and the KPC-3 and computer is
sufficient for APRS :)

Ours used to be "secure", but when the new director took over, he
pulled all the blankets off and made it useful.
Turns out a lot of the "security" was apparently to conceal how
little was getting done.

We are down the hall from 911, but have free access to it when
needed.
We also have backup radios for police, fire etc in our room, should
we need to go direct, and the authority to use them. (covered under
EOC, not FCC)

We still have one hardline that got wet, but we sealed the top end
about a year ago, and this friday we will light it up with UHF and
check for loss with a couple of birds and a dummy load. If it looks
ok, then we'll use it for HF and cell phone passive repeater. (not
much cell signal in the dungeon)

**** YES! This software is now updated to reflect the April 15th
**** changes in FCC licencing structure for Amateur Radio. The software
**** contains questions for the new and old ham tests as well as
**** the unchanged professional tests.

Greetings!

dauntless-soft.com is pleased to offer high quality MS-Windows test
preparation software for the FCC/HAM plus some Professional tests
available for shareware download at http://www.dauntless-soft.com.
(aka http://www.hamexam.com -- easy to remember address--tell your
mates!) The program will drill you for the following elements:

ELEMENT
2 (NEW) Technician
3 (NEW) General
4 (NEW) Extra
2 (pre April 14, 2000) Novice
3A (pre April 14, 2000) Technician
3B (pre April 14, 2000) General
4A (pre April 14, 2000) Advanced
4B (pre April 14, 2000) Extra
1 GROL Basic Radio Law
3 GROL General Radiotelephone
7 Radar Endorsement - Ship Radar Techniques
8 GMDSS Radio Operating Practices
9 GMDSS Radio Maintenance

You are welcome to download this and give it a try. Secure online
registration is available--a $30 registration unlocks ALL the questions
and entitles you to FREE LIFETIME UNLIMITED UPGRADES of the
software. That's less than $3/test.

This software is based around the same engine that drives our FAA test
prep software that has helped many pilots score very highly on those
exams. (Yes, we got a new hobby and decided it was time to write
software for it, too!)

Thanks for your time. We look forward to your visit!

> And...I was out of there. I didn't even care if it was a rumor, I
> was headed for safer ground. <:-))

I just went through a similar sit, thursday before dayton.
Got the dents to prove it too.
I just missed the band of baseball to grapefruit hail.
We did pick up one fellow on I-70 headed to dayton (ham, happened to
tune us in) and got him to pull off and wait.
He was very glad. Then, I ran into him at Dayton, when he was
telling the story :)

> Had we had ARPS one transmission would have told them right where I
> was. The biggest drawback is trying to read the screen and/or
> entering any kind of data has to take your attention away from
> driving and away from the storm.

You don't want to do this sort of thing moving, no.
The "fill in blank" format is designed to be as fast as possible to
enter, as opposed to the normal message format where every letter has
to be "twiddled" in, (like the TH-D7 HT)
Voice is best, for reporting while moving, but you know what a voice
net can be like too.
With the HH, you can fire in your reports much faster, and they are
immediately available to your buddies (with hamhuds) as well, and
interpreted relative to their position!

We're evolving the skywarn version, as we learn more about applying
it in real life.
Steve is the exact opposite of MicroSloth. His software usually
works, and he listens to users :)

> What's it do with foot to the floor acelleration<:-))

It will notice that you're moving within about 50', speed irrelevant.

The big stuff is usually quite localized. It might cover some ones yard, or
a city block, but usually not much more. Thing is you never know where it's
going to drop the next bunch.

I can turn around and talk to any of the 911 operators, or go to their position if necessary. That makes it real handy for passing information called in on to the people in the field. (typically done on packet)

> We also have backup radios for police, fire etc in our room, should

We too, work directly with the EOC, or more properly "for" the EOC. OH! head of EOC is also a ham. He saw what we could do and promptly got his license.

Well, we downchecked it because it was dripping water out at the
other end.
I had been sitting for seven years, in the secure secret eoc station,
unterminated, and getting water from above.
It's a pretty long bit up to the roof, 3 story building, and we're in
the basement.

I am selling my Kenwood TS-690 SAT. It covers 160 thru 6m and is a great radio. Has a few scratches from being used mobile 3 or 4 times but is in overall good shape and works perfectly. Comes with hand mike, auto antenna tuner, and yk-88sn-1 1.8KHZ SSB filter. Cost over $1850 when purchased new 4 years ago. I am the original non-smoking owner. Will sell for $1100 plus shipping. Contact wa5rt Thanks Rick

Of course I'm not, and I didn't claim to be. I do, however, have
at least a passing grasp of the use of punctuation, capitalization,
correct spelling, complete sentences, and coherent thoughts within
those sentences!

By the way, your post to me is full of its own spelling and grammar
errors. May I assume that you don't live in a glass house?

Hi Folks!

Ii¿½am trying to connect my TS-850 to my Computer in order to control the rig by software.
I tried the interface shown in www.mods.dk but it does not work. I seems just too simple as it uses only one diode and one resistor. I cannot believe that this is all you have to do as Kenwood sells the IF232C interface for many $$. Can anyone help me out, and mail me the schematics or a URL, where I can find them.
I heard the 850 uses 4800 baud, but what parity? How many data bits? Stop bits?

Thanks for your help!

Marco -- DJ5KW

Don:

I've found used rigs in the 5-15 year range to be as much or more reliable than new. In your price range, new will buy you a stripped down rig, where used will get you a middle range radio. The analogy is very similar to stereo equipment...
Strongly suggest you look at the Icom IC-706 which would allow you to take the rig with you portable, mobile, and give you 6 and 2 meter multimode so that you can experience all the key bands plus general coverage. Used price about $600 +/- and the resale opportunity is pretty good in case you want to upgrade radios later. Other Icoms to look at in this range are the IC-735, or IC-751/A. I think the Yaesu mid range equivalent is the FT-840. Might also want to consider a Kenwood TS-440.

Just wate until your over 60 and you 60 WPM typin goes down hill...What was fat fingering becomes a way of life...then you fingers dicide that "a" belongs in nearly all words, that "d" and "k" have traded places....That's about the time you need to hire a proof reader as the ones built into the word processors do not catch many of the gramatical errors mixed in with the spelling errors and you start tending toward runon sentences with random punctuation,

For those who don't need spell checkers and syntax checkers and have never mispelled a word in their lives, just wait until you suddely can't remember the word you were trying to spell. And...all of this happens *before* you get old. <:-))

Then with strong bifocals you can tell there is something on the screen, but often have to take them off to read it, or put them on to read it, or just throw them in a corner.

Gettin' old is Hell, but it sure beats the alternative!

Which is because many telephone users weren't smart enough to realize that
thing in their hand was a radio...

Now that the majority sold are digital, or unreadable in a plain receiver
it shouldn't make any difference if you could receive them or not, but
unfortunately there are still some of the old hand sets out there that users
still think are secure.

Most of the larger ones (that go to 300, or 500 pf) usually only go down to
a minimum of 5, or 10 pf, but there may be some that go to 1pf, but I don't
think they will be cheap.

Greetings,

I am looking for a third party level convert for ICOM rigs. I know
there is
plans for one, but I would prefer to buy one already built. Any
pointers?

thanks

479. Problems with KightKit T-175 Linear (again)

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-07 00:00:00 UTC
From: WB3KUM/9 <d.breeden@NOSPAMwcom.com>
Message-ID: <393E93DB.C1259A2C@NOSPAMwcom.com>
Source record: 77866
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I'm back, completely frustrated. I will freely admit I got ripped off.
The IDIOT that had this before me, in addition to completely hosing up
the B+ supply, worked very hard to replace the 6JE6s with 6KM6. He had
to unsolder and swap the plate caps!! Works OK on 10 meters, doesn't
work on 6 meters at all. I get more power out in bypass. So much for
this weekends VHF contest.

Opinions, do I

spend $70-$100 on correct tubes.
use it as a basic chassis for some other tube(s), i.e. 6146, 807, 829B,
2E24, 2E26, ?
are there any good simple plans for a 6 meter linear using one of these
newer power modules?

Sorry, $300+ for a TE or other is currently out of my price range I
really don't need that much power. 50 to 100W is fine.

Many thanks to all in advance.

Dennis WB3KUM/9

480. Re: Mounting High-Power 2m Mobiles (heat dissipation)...

I own a IC2100 and the heatsink gets hot!! Especially if you transmit at 50w for a while. All heat sinks need air flow so keep that in mind I saw one setup where the person put a 31/2" computer fan on the heatsink then stuffed it in a slot in the dashboard. Looked good and there is probably lots of air flow. The fan runs on 12V so it is compatible with the car's electrical system.

All The manufacturer does is block those frequencies. It is the same with ham radios. Look at any advertisement for a radio that would cover those freq.'s and it will say cellular blocked.

494. dual receive as per FT1000D using two separate rigs

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-07 00:00:00 UTC
From: Anthony Roskilly <Morse.Key@btinternet.com>
Message-ID: <8hmetd$6sa$1@plutonium.btinternet.com>
Source record: 77881

I am considering trying to have two rigs with their receivers running off
the station antenna (HF2V or HF6V verts)
so that I can do split freq dx and other band monitoring as per the Yaesu
FT1000D. Has anyone tried this?
I was going to T off from the RX o/p of one rig to the ant input of the
other rig and have a couple of outboard
receiver antenna matching units to overcome the impedance mismatch
losses.... although this would be fiddly
it may work and could give some additional front end selectivity.

I must admit when I had a FT1000D I found the ability to listen to the
pileup side of split freq DX really helped
and would like to emulate this.

Of all the tubes mentioned the 6146 is the only thing worth
considering. If the amp used "sweep tubes" then you will have to
reduce the plate voltage to around 800 under load.

Considering how "hosed up" the thing is and it works somewhat on ten I
would look at the input and the output circuitry. Sounds to me like it
was butchered to work on 11 meters, and thats all.

My TM-V7 is mounted in the dash, where the ash tray used to be.
Makes sense to me that if a 50W stereo can keep cool there, a 50W
transciever can too.

Well, a "50W stereo" (whatever that is...) rarely, if ever, runs
at 50W. Unless it's mounted in my 33-year-old Jeep, the audio
section(s) are perking along at 2-3-4-5 watts -- and then
only at audio peaks. (In my Jeep you might have to run it full
blast to hear anything.)

A mobile 50W FM rig is 'doing' 50W watts the full time it's keyed.
Then it drops back to it's receive mode dissipation on key up.

A 50W FM mobile rig can get a whale of a lot hotter than
any "50W stereo".

Hello,

I have a Yaesu FT-900/AT for sale. Cosmetically a 7/10, working order a 10/10. This rig comes with factory ceramic filter, hand mic (HM-31), separation cable, and manual. I have used this rig as a base rig with great audio reports, the auto tuner works wonderful (tunes a mobile whip or dipole) and it all fits in a pretty small package. Here are some links to pages about the Yaesu FT-900/AT

http://www.radioplace.com/products/yaesu/ft900.html

Parts are hard to find on old Kenwoods; money best spent on NEW rigs
because:
1.service
2.better built
3.parts
4.support
5.Not a lot of money difference between new and good used rig. If its
cheap there's a reason!

Hello all,
I have a Kenwood TS-440S HF Transceiver for sale. Working condition is 100%, puts out a full 100 watts on all bands. Mars/Cap Mod has been done. Cosmetically it is good. The top cover has some scratches and marks on the paint and the top of the face is worn. It comes with an instruction manual, hand mic, and power cord. The serial # is 7060100.
Any questions, please email me (remove nospam from email address).
The rig has no additional filters and no internal antenna tuner.
To see pics of the rig go to this link:

http://members.tripod.com/kv16/ts-440s.jpg

Price $400.00 plus shipping from 11710

I assume you mean the firmware. Yes, it is possible,
but probably not by yourself - I don't think it's
available for downloads.

> If so, can you tell me the latest
> revision, where to get it and how to upload it.

Latest revision is 1.30, I got it by sending my radio
to Yaesu in Cerritos CA for an upgrade.

The typical manufacturer to dealer price margin (i.e. dealer cost) in the amateur radio industry is only 25%. And, dealers are typically only making 2 to 4% on each sale. I assure you no one is getting rich in the amateur market.

Conversely, the commercial or land mobile market has markups far exceeding this level.

73,
Don Allen W9CW

I purchased this rig about 2 months ago and don't find enough 10 meter activity available while I am driving. I generally drive to work before sunrise and home about dark. I have used the rig mobile the whole time but it is in excellent shape with only minor scratches on the side. It comes with the original mic, mobile bracket, power cord with a cig lighter plug on the end, manual and original box. It has always been in a smoke free environment.

I am asking $ 90.00, price is firm.

Email me if interested.

I vote for simple. The IC706, unlike some radios, is happy running off a car battery, whether it is fully charged or not. Ask other users about the Alinco or Yaesu equivalents. Go for dipole antennas held up with string. A buddy of mine uses a dipole split with insulators to allow use on various bands, and has alligator clips to short out across the insulators to change bands. The whole setup could fit into an attache case, maybe including a small gel-cell battery. However, if you have access to a car, why not use the battery out of the car? Some guys like QRP, although QRP with low-key antennas is not as easy as QRP with a tower and beam.

Tain't nothing in the header indicating that rec...swap is even in there.
The original troller sure got every thing in the UK though.
And I can hit reply which will go e-mail, or reply group. I do not have the
luxury of editing who gets it unless I create a new post.

I've only seen it on equipment and we are certainly talking about equipment,
or coax was equipment last time I checked.

Does anyone know how to control the dial light on a Yaesu FT-5100 dual band,
2/440 transceiver?
Thanks,
Charlie

>Another reason to get a ham license:
>It wouldn't surprise me to soon see scanners outlawed. However
>In a fit of wisdom congress made a law that said ham operators
>could have receivers that would receive law enforcement signals......
>nuff said....
>

1==> Does this mean that the Icom general coverage receiver that
covers from 100 KHz up to 2.2 GHz or so will now be available in the
US? Have a mate who has one, and before buying it he was showing me
the details from an electronics catalog. Noted that there was a
warning that this continuous coverage communications receiver was
not available to US customers.

2==> However, even if the law allows a receiver owner to monitor a
communication, it may still be illegal for him to communicate that
information to anyone else, use the information for an illegal
purpose, etc.

I actually already tried this translation program, but would you try
to modify your rig following a text which sounds like:

"Thus: On a not scratching document puts device with the face (display)
(thick cloth/rag), whereby the antenna socket away from us shows. Remove
possibly available Akkupack."

Ok, I'm not an english speaker, but this is not the worst part I've seen
in babelfish translation...

I'd prefer an human translation if possible.

I've had good results using a padded HT case called "The Pouch". They're available at most ham dealers. It has a buckle in the belt loop that allows me to fasten it around the handlebars. It doesn't provide a rigid mount, but I think that might actually be better for the radio by not transferring too much road vibration.

535. Mounting High-Power 2m Mobiles (heat dissipation)...

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-07 00:00:00 UTC
From: mjlinden@my-deja.com
Message-ID: <8hlg6s$s5t$1@nnrp1.deja.com>
Source record: 77936

I recently picked-up an Icom IC-2100H 2m mobile rig (55w) and am mulling over mounting locations in my car (a 1991 Mitsubishi Eclipse). I've got two options... Below the dash to the left of the center console where the display will not be easy to see. Or, in the second stereo DIN slot in the center console where heat dissipation may be a problem.
The below the dash spot is not my favorite choice because I'd have to look around the steering wheel spoke in order to see the display when changing frequencies, etc. On the other hand, I'm a bit concerned about the lack of air flow that the rig will get if I mount it in the center console. This console is not very open to the rest of the car in the back and I understand that these high power rigs produce a lot of heat on transmit. Although this might work OK for the stereo, I don't know if it will be good enough for the rig.
If anyone has experience in this arena, I'd sure appreciate your input!

Thanks, Michael J. Linden N9BDF

No, those scanners are not available not because of law enforcement
frequencies but because they cover cellular phone frequencies. It is
illegal to intercept cellular phone transmissions even if you are a ham
operator.

Okay, folks, what happened to spelling and grammar? How many
times have you seen an ad like this on a newsgroup recently?

"for sell amatuer ham raido equiptment not suer what it does
im not a ham not in to bad of shape dont no if it works came
from an old mans estate been seting on a shelfs in garage for
years their are 8 items whant to sale all for one money make
me a offer im not to suer what their worth so dont rip me of
thanks and 73's.bubba"

Presumably, these ads are being posted by adults, and it's
probably fair to assume that they at least graduated from
high school. I was always under the impression that one
had to know how to read and write to graduate. Apparently,
I was wrong.

I have my Nomex firesuit on (I'm sure the "flames" will be
flying my way soon).

73,
Dean, K5DH

Hi,
I have for sale a National NC-303 receiver. The RX covers 160-10 meters. The dial is also calibrated to cover 6,2,11/4 meters with converters (not included). Has XCU-300 xtal. calib. and copy of the owner/maint. manual. Front panel is a 9 out of 10 and the cabinet is an 8 out of 10 only because of a couple small nicks. No rust, dents, corrosion. Operates excellent on all bands and is well calibrated. This is a nice radio. $275 I will split shipping or if you pick it up I will negotiate the price a little. Radio is located in CT. 06248. Thanks Gary

I can see the bad spelling and grammer as being forgiveable in only two instances. One being that the person is a foreigner and has not yet learned sufficient English. Two being that the person is from south of the Mason Dixon line and is the innocent victim of the extensive inbreeding in that area. In this area it is also common for residents to refer to "my senior year" and actually be talking about the 5th grade.

I have a really nice Hallicrafters SX-28A HF/VHF Receiver for auction.
This is from 1941-1944. I even have the original manual for this!
This covers 500 kHz - 43 MHz; AM, CW, USB, LSB modes.
This was the Top-Of-The-Line receiver of its day! There is no reserve!

560. Re: Hamfest Prices Observation

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-08 00:00:00 UTC
From: Willie Peloquin <wpeloqui@ismi.net>
Message-ID: <8honjvaov1@nnrp1.deja.com>
Source record: 77805

I noticed prices on radios that were higher than the retail prices offered on new equipment. There are a few bargains though. I think one problem is the falling price of equipment. If someone spent $500 for a 2m FM radio, they will try to sell it for $250 or more. New 2m radios are available for well under $250, for a good Kenwood or Icom radio. That probably has many more features and higher power.

Just my thoughts,

73,

Willie

Your a/c vent tubing should be running back there somewhere, make a small hole in that and let the vent do the cooling during hot time and put a piece somethig over it during winter when the heater is in use. find a small 12v fan and rig a switch for the winter. Brodie

Nope, and I got mine back around December. I think you have to order it
(service manual) as a separate package from your local dealer or direct from
Icom.

need to agree here (note intentional lack of upper case letters).

As I understand it, Vern feels that we're all stupid because we didn't do CW at 16wpm. I'm a new "Advanced", and proud of it. Move on Vern. Things change; as does language. I'm personally thrilled when I can understand the point posters (from all over the world) are trying to make. Vern buddy, work on your compositional skills. Spelling is not all there is to writing. While you're at it, try to develop a sense of humor.

Stanford Doctor O' Fine Arts.

I was just reading about batteries and saw that NiMH batteries are great if you need a lot of power but that they lose there charge at the rate of 4% to 5% a day even if not used during that time. NiCd also lose 1% to 2% a day. Seems that the only batteries that will retain a charge for a longer time is the rechargeable Alkaline which is suppose to be 4 to 5 years. The alkaline does not have the power capacity but then it might have more if you are like me. I will charge a battery and then expect to use it a couple of weeks latter. I noticed this with my digital camera and have now read it so do believe it. Quess I will not buy anymore NiMH batteries. Just bought some rechargeable Alkaline so will be giving then a try in the camera. I have had good luck with NiCd's.

This might not have answered your question but thought it might be of interest to you. Sounds like your charger migth be broken.

I have two of the NiMH packs (MH-PB-39H 6V 1800mAh).

I have never had a problem with them losing a charge and even after a month
in the drawer work fine. After a month in the drawer all of my NiCds need
to be recharged.

NiCd also lose 1%

And I've never had good luck with NiCds.
Even with the conditioning every couple of months, mine are good for about
two years at most. The Metal Hydrides are two years old and still hold a
good charge for several months.

Can the RCI 2970hp radio be fed into a Texas Star 350HDV ?

The specs on the 350 states 4 watts in with 180 out or
20 watts in with 350 watts out.

Can I reduce the RF gain on the 2970 in order to have a lower
output into the 350 and have it work ?

The 2970 does have the built in amp and I was told it cannot
be done as it may damage the radio.

574. handheld intermod problems

I own an Alinco DJ-F1T handheld 2m transceiver. Since moving into a high-rise apartment near the centre of a city of 750,000 people I am now suffering intermod problems from pager transmitters, which of course, did not occur in my previous country residence!

Does anyone know of a simple filter to build or purchase, or a mod of some sort, that might help solve my problem. I know of large 4 pole filters on the market but they are not really appropriate for a handheld. Any suggestions would be appreciated.

I own an old PacComm Pactor Controller with the 2.02 firmware, PCB revision 1.31 and a SN ORO5xx. A couple of weeks ago there was a discussion on one of the news groups of this Controller that painted a somewhat negative picture of its capabilities. I have never put this unit on the air and was wondering if I should upgrade to a different firmware? I would also like a few general comments on this particular unit for use in this day and age. 73, Ron, K4KTB, Tulsa, OK

Hello,

I have a Yaesu FT-900/AT for sale. Cosmetically a 7/10, working order a 10/10. This rig comes with factory ceramic filter, hand mic (HM-31), separation cable, and manual. I have used this rig as a base rig with great audio reports, the auto tuner works wonderful (tunes a mobile whip or dipole) and it all fits in a pretty small package. Here are some links to pages about the Yaesu FT-900/AT

http://www.radioplace.com/products/yaesu/ft900.html

http://electrohellas.simplenet.com/amateur/ft900.htm

Asking $700.00 shipped Cont. US

580. What if...someone was going to buy your next HF rig?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-08 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <20000608191557.14219.00002148@ng-cl1.aol.com>
Source record: 77825

Hello all !

Here is an interesting question:

What if someone was going you buy you one of the following rigs and you were going to have to keep this rig for the next 20 years, which would you choose?

Yaesu FT-920

Yaesu FT-1000MP

ICOM 746

Which rig in your opinion would keep you the happiest the longest? Think about what you know and have read about the three rigs...just because its the most expensive doesn't always mean its the best or trouble free.... or that its performance is superior... which would you choose?

Ok to throw in a ringer you are on a deserted island in the middle of now where and low and behold there is a electical socket nailed to a lone palm tree....

What rig are you going to spend the next 20 years with?? !

73 all... =)

Interesting; my experience has been that NiMH batteries hold their
charge in storage substantially better than NiCD ones. I don' have
specific numbers for amount lost per day, but when I store one of each
for a month, the NiMH is mostly charged afterwards and the NiCD is
dead. These are batteries which have comparable capacities
when used immediately after charging.

You can turn the 2970 down so it'll properly
load the 350. The problem is that you're
running a radio that already has a 2-pill
amp built-in into another 2-pill amp. You
have to be very careful not to overdrive the
350.

And, it's not the RF Gain that needs to be
lowered--it's the RF Power. You should have
a tech remove TR32, and look into getting
a bigger amp. That radio will adequately
drive an 8-pill amp (like a Texas Star DX1600).
Using that radio to drive a 350 is basically
redundant since the radio already has a 2-pill
amp in it.

I hope this helps.

Wish I could remember exectally where I got mine. Search for Dick Robinson on qrz.com and email him. He had some made by someone else that came with some sat tracking softwear. The softwear is useless with what I have, but the interface works just fine. It is a db25 serial plug with a 3 conductor 1/8 inch phono plug. Think it was $ 33 including shipping and I got it in less than a week from the time I sent off a money order. You might ask this in the icom mkllg mailing list.

Hi,
I passed my CW exam a few days ago, and I was looking to buy an hf radio. I found one that fits my budget the: kenwood ts-50s. I have a few questions i was wondering if someone can help me out. I have an Astron RS-20A 20amp surge 16amp continus powersupply, and I was wondering if it would work with the TS-50s?

Second I live in an apartment building and it is difficult for me to put up a big antenna. I was wondering what kind of antenna i can get without buying an antenna tuner? I don't exactly need it to work on all the bands..40-whatever meters is fine. I don't plan on using anything higher than 40 meters. Anyone have any ideas or suggestions?

Thanks,
Felix

PAR Electronics makes some excellent filters for precisely this problem.
AES sells them,
www.aesham.com or you might try www.parelectronics.com (not sure about
that website, but their email address is par@parelectronics.com). They
aren't cheap, but are small enough to fit on top of your H/T. I use one on
a mobile VHF radio and it works great.

I know that... How long do you talk??? (that's what heat sink mass is
for)
Long term, you shouldn't average any higher than 50% talk.
Short term, typical worst case, the duration of a repeater timeout,
plus a bit at 100%.

I run mine on APRS on one side, keeping it pretty active while I'm
driving, and voice on the other.
Never had any hint of overheating, summer or winter, even during
skywarn nets when I've had to run net control from the car.

> A 50W FM mobile rig can get a whale of a lot hotter than
> any "50W stereo".

Well. Let's not debate that one. A class A 50w amp would roast your
toast, and my explorer isn't that quiet either.

Probably meaning 4% on top of all costs, including inventory and
overhead.
Still, that seems slim, I guess it depends on what the owners take
home as pay.

Source record: 77962

Having worked for a ham dealer a few years ago I can attest to the fact that most equipment has a 5% markup or less. Accessories and other smaller items tend to have greater markup (10-20%). It's not at all unusual to make $100 or less on a $2000 HF rig (before expenses). As you can imagine one has to turn quite a volume in order to pay the bills.

It's relatively easy to come to the conclusion that ham dealers make very little money. Think about how many "large" equipment dealers there are in the US (probably only three or four). The rest work out of very small run down shops or their home. Also, if you've been around the hobby for more than just a few years you've probably noticed how many dealers appear and then disappear from the scene.

Why is there such little profit in amateur radio gear? I am not an economist but here are some contributing factors:

- By and large hams are very cheap (I can say that because I am one). Quite a few hams will toss any kind of loyalty out the window if they can save a dollar or two. I've known many hams to ask their local dealer to support their club but many of those same people will call a dealer in another state to order equipment if the price is just a few dollars less.
- Hams tend to expect to 'deal' on ham gear like they are negotiating with someone in a hamfest flea market. Asking the dealer to 'pay the tax' or take less than his advertised price is a strange but unfortunately common practice. Would you go to Best Buy or Circuit City and ask them to take $100 off the price of a stereo receiver or have them 'pay the tax'?
- Ham dealers have to compete in a national market. Although people tend to buy other types of electronic equipment locally (such as computers and stereo gear), ham dealers have to compete against every other dealer in the country that has an 800 number. More competition obviously forces prices down.
- Larger dealers can sometimes get 'deals' from manufacturers when smaller dealers can't. The smaller dealers have to drop their prices (sometimes very close to cost) just to move equipment.

It comes down to this - most dealers are in the business because they enjoy the hobby. If the business were more profitable you'd see more dealers with better shops (and driving something other than a 10 year old broken down truck to a hamfest).

Kenwood TS-850SAT for sale.
It is in excellent condition both physically and electrically. Auto
tuner works great.
50 mil. serial number. Clean and works great. No scratch or ding.
Just a couple of small and fine pen marks on the option bay door. Front
is in perfect condition.
It comes with MC-60 desk microphone which is also in near mint
condition,
but no hand mic, boxes, or filters.
It also comes with original manual.
Price is $825 (in USD) plus actual shipping cost by UPS (around $35 for
most locations in North America).

Anyone who hasn't worked in the amateur industry, either as a manufacturer, importer, or dealer, would certainly doubt the small margins on most major ham gear. But, I assure you that the 25% dealer discount from the manufacturer is indeed the standard in the industry. And, also true, is the small margins that most dealers work with on their larger inventory items -- typically, 5% or less -- some only making 2 "ponts" or 2% on some products. Yes, it is true, that small accessories will have larger margins -- but, you don't pay leasing costs, employee costs, inventory costs, cost of credit, etc. with small ticket items. Due to the small margins at the dealer level, they must sell in volume. Just check the dwindling number of ham dealers in the ad indexes of QST and CQ . . . this outlines the trend.

Again, as a former Marketing Manager for an amateur radio manufacturer, there is absolutely no reason for me to be untruthful on this. Actually, it should be a bit enlightening for hams. While many hams who don't work in the amateur industry are fully vested in pension plans, full medical insurance plans, company matching 401-K plans, most who work in the amateur industry, either in manufacturing or at the dealer level, have fewer corporate benefits by far. I speak from experience on this There is no such thing as a pension plan in many companies and most often, no matching 401-Ks. 401-Ks yes, but not matching . . .

As in the banking business or in the airline industry, we all are going to look around someday and find only ONE amateur dealer standing after the bankrupcy dust settles. And, then, guess what the selling prices will be.

If anyone would like to discuss this in more detail, I would be happy to talk with you on the phone.

Its now at $400, you might want to take a look.

TM-941 Kenwood Tribander 2mtr/440/1.2Ghz. Excellent condition,
some scratches on bottom of mobile bracket. Original box, power cord,
manual and mic. Non smoker. This is an excellent radio, I really like
the large display and the ability to mount the head remotely
(I donï¿½t have the cable for this rig but it is available).
I purchased a 942 and no longer need the 941.
The radio is guaranteed to work on arrival. If you have any questions
please email me.
If you want to see more photos please check out
www.home.earthlink.net/~ajury

Thanks for your time, Art KF7GD

Hi Don

What ever you end up with I hope you enjoy it for a long time to come. You did not mention if the price range is just for the rig or must it include other things such as an antenna or tuner etc.... If it must include a tuner then you might want to think about something like the Yaesu 890 AT. It is only hf but it works well. The Kenwood 430 or 440 as well as the Icom 735 are all about in the same price range for used radios. I think that you would be hard pressed to find a new radio in the 4-700 price range, although you might. You might try the Kenwood TS50, I think it is about in that price range and is still sold new. Drawbacks: all the previously mentioned radios work on 12 (13.8) VDC. Which also means you will need a power supply. You might want to consider other power supplies that the ones from the radio manufactures. They work just as well and are usually less expensive. But above all else find a local ham that has been around for a while. Quite often they will help with antenna projects and sometime even donate materials such as scrap wire for wire antennas which cost a lot less than the beams and verticals. If there is a local club in your area you might check with them, sometimes radios get donated to clubs to be sold. Good luck to you Don & 73's

If I remember the original post correctly, he had 300-700 for a rig. That lets out a decent new rig. An Icom 730 or 735, or Kenwood TS-440 or 450 are tough, handsome, and available in the used market. I sold my IC-730 this year, wish I had it back The rigs I have listed I have owned and I highly recommend them for not only a new entry but one of us old farts too! For mobiling the 440 is a little bit better than the 450 because the little buttons and driving don't go together in traffic, but that 450 is a bad ass rig whether fixed or mobile and all these rigs are within the price range he has set. The 440/450s are going for 7-800 with tuner and filter/filters. The 730 goes for around 300 and the 735 for around 350-400 bucks. Great ol rigs!

You got that right! Curiously, English lacks a unique verb tense for something that is done continuously. We have past, present, and future tense but must use the present tense when we really want a continuous tense. Some Black accents have corrected that by prefacing the verb with "be" as in "I hear her dad is after him" "Yup, he be running". Naturally, the more conservative deem this a flaw and miss much humor thereby.

629. Re: Hamfest Prices Observation

I believe selling prices reflect what a buyer is willing to pay. Ebay is a fact of life (it's not going to go away boys and girls), and you can usually get top dollar for any item you list there because of its huge audience. As a matter of fact, people pay above retail prices there - I still can't figure that out but I've seen it happen on several occasions.

Anyhow, why expect someone to sell their item for less at a hamfest than what they can sell it for on the net? Most people want as much as their item can bring - I know I do.

If you can sell it for $60 on the net, you can bet it'll be marked $60 at the hamfest too - not less. Unless of course, I'm just there to have fun and don't really care about the money ---- Uh, yeah, right.... :))

Just my 2¢...

John

I have just acquired a Regency HR-2B as my first radio.
However, all I have is a radio (well, one and a half, for parts).

There are a lot of crystals in it, although I may need different ones
for the local repeater. But, I have no microphone, or documentation.
I need both...

If anyone can provide me with a source of information I would be
very grateful. I *think* the microphone plugs into a phono jack on
the side of the unit, near the front. I could be wrong, but if so the
only other possibility I see is wiring it to the screw terminals in
back?

I am hoping to find a manual, schematic, or some other source of info
as well. Does this model appear in any books? If anyone has
documentation, would you be willing to provide me with a copy?

I'm open to other suggestions, as well.

Thanks...

Even (especially?) humans err. I was disassembling Japanese a motor following the very precise directions in the manual. "10. Remove screws from cover" Done. "11. Tap cover gently with rawhide mallot at point indicated in figure 3" Tap, tap, gloop ... 5 quarts of oil all over my bench! "12. Is assuming oil has been drained ..."

I agree; question is what if anything can be done. IMHO the situation reflects the shrinking number of active money-spending Hams. Technology - our inability to build modern equipment without $multi-million investment has pretty much eliminated the soldering-iron experimenter/home-brewer from our ranks; making us all "appliance Hams". Sure, there are many old-timers out there, enought to support rec.boatanchors, but they aren't buying many new $2500 rigs they don't understand and cannot fix if they did! Second, competition from other media, such as CB and this NG, are making it hard for newcomers to justify buying amature vs computer equipment when we have placed so many hurdles (eg, code) in their way. I sincerely hope that the revised rules will help sell HF equipment to "welfare" Hams like myself, but eliminating code requirements entirely would do even more. I have four friends, all "no-code techs" who bought into 2m and would buy HF rigs if they only had to pass the General written exam ... if the mfgr's and dealers don't go broke first. These are all ex-militery technicians well versed in electronics but unwilling to have code "shoved down their throats".

Dean,

You are so right.
This is just one more example of the computer-generation "dumbing down." Unfortunately the use of lower case letters for proper nouns is beginning to creep into areas where the authors should know better...corporate advertising and the media.
Just like the FCC/ARRL Ham License Give-Away Bonanza, expect to continue seeing lowered standards for those who lack initiative.
No wonder Johnny can't write....or add....or think anymore. Bill Bennett is correct, no one is outraged anymore about anything and performance standards are under attack by not only schools, FCC and media but also, sadly, the people.

636. Re: FT-1000MP much superior over FT-920?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-08 00:00:00 UTC
From: John <jh-lewis@swbell.net>
Message-ID: <dTN%4.1492$3P6.322560@nnrp3.sbc.net>
Source record: 77992

I've had both, and depending on who you talk to the MP is either worth the extra money or it's not - to me, it's wasn't. I'll work an occasional 'dx' station, and seldom do any contesting. The 920 was sufficient for my activities, although I did sell it because of the blow by with the filtering system which drove me nuts. I didn't want to pay the extra money to get around the problem...

If your heavy into contesting and DX work the MP may be the rig for you, simply because of the optional filtering capabilities it has available. "You can't work 'em if you can't hear 'em" is still true, and with the extra filtering, the MP does shine as a DX and contesting rig -- but be aware that it also requires about an extra $800 in filters (on top of the price of the radio) to really perform well. And with the price of the extra filters you're approaching the price of a Icom Pro (my top choice - super radio). Only you can decide if the hefty expense is necessary for the level of hamming you do...

Myself, as a good comprise, I've gone back to my trusty ole 990, and am still very happy with it despite all the other rigs I've had and tried. IMHO, if you can find a nice 990 for sale, grab it. They're great radios, relatively inexpensive (only about $1,000 up, depending on options), great receiver, excellent 'digital' filtering and the 'most bang for the buck' rig you can get.

Just my 2¢ - not 'gospel' :)

John

Jh missed the point when he wrote: "Anyhow, why expect someone to sell their item for less at a hamfest than
what they can sell it for on the net? Most people want as much as their item can bring - I know I do."

I wasn't suggesting that people sell their items for less at hamfests; I was merely observing the changing trend. Hamfest prices are now equivalent to internet prices, at least in PA. In the past, many items were bought at hamfests and then resold on the Newsgroups and on eBay at a profit. If there is no markup to be had by buying low at a fest and selling higher on the net, there will be no incentive to resell. This is my observation of economics at work and how the internet is changing the face of Ham Radio economics. I find it interesting. One effect of this trend is higher prices for used equipment. I wonder if the need for used equipment will eventually level out, and if prices will fall, given the limited number of hams around? Any economists care to comment?

Hey Brooks, since you've opted to call people names on the net again, I'll have to inform this newsgroup of a fellow resident of the City of Troy, New York. The last time you called someone a "dick smoker," somebody followed up with the posting where you admitted you are HIV positive and take many of the prescribed drugs for that disease - so I think it's a little more likely that you have engaged in that type of conduct. ;-)

Gary Brooks, who has at least one felony conviction and at least one DUI in his past according to the Troy Police Department, is most-widely known on the internet as a dealer in counterfeit Microsoft software out of his subsidized housing project a few blocks away from me on 114th Street here in Troy. Brooks used to deal in copies of Microsoft Office Pro 97 for as low as $52.00 and copies of NT Workstation for about $60.00.

He's had a number of email such as flash@wizvax.net and has disguised himself as a female customer of himself to "verify" the authenticity of his counterfeit product.

After heckling some poor bastard down in Virginia with a bunch of some true, some false allegations, the guy went to work on Brooks and from what I can recall, eventually ended up getting this guy arrested and charged with two felonies - criminal possession of computer software and possession of counterfeit computer software. The guy is Virginia ended up suing this idiot, and from what I recall, Brooks defaulted on the lawsuit to the tune of $150,000. Several months after defaulting, Brooks asked the court to set aside the default judgment because he "was sick" and the guy and the court AGREED on condition that Brooks make any further argument about the case in person.

The guy apparently agreed to settle with Brooks, accepting the approximately $3000 the Renesslaer County Sheriff seized out of Brooks' account under Court order.

Judging by other postings in DEJA NEWS, my fellow Troy resident is again dealing in Microsoft product of questionable authenticity.

What ever happened to your two felony charges, Brooks?

FWIW, Brooks is not only a convicted felon, he's also a RAT having "ratted" out people above him in order to try and get a lesser sentence, to include at least one company in Arizona.

He's also got an outstanding criminal warrant down in Virginia, now we see he's settled into illegal modifications to communications equipment.

What a jerk.

OK. Try that on UHF and see how far you get. Amplifiers have their place.
You have to be smart enough to know when and when you don't need one.

I use their 2.1 KHz crystal filter in my Yaesu FT-847. Makes a big
difference in how the rig sounds on SSB, much more selective with much less
AGC pumping. The filter has a good shape factor (1.4 I think) and is
designed for a 455 KHz IF.

My question was "The rest of my life with?" May be the same as 20 years.
My answer was the FT-1000MP. As we begin planning for retirement, SWMBO
insists that my purchases are ones that will last me the rest of my
life. I love my Delta Unisaw and I've got my eye on a Nikon F5 :)

I've always bought cheap because there were more important things for
the money to go for. (food, kids clothes, etc.) I now understand what
they say over on rec.woodworking: "Cry once"

The radio is called a "loss leader" in the trade. The real bucks are made in the accessories sold for it.

For example, Polaroid sells their cameras practically at cost because they know the real bucks are in selling the film.

And so it goes.....

The problem is that "very small" bit of effort is so misguided that it's killing Amature Radio. A major goal of Amature Radio is to maintain a pool of skilled operators and code was once essential to that goal; but no more because nobody except Hams use it anymore. Given that, it is lunacy to demand everyone learn a mode of communications so archaic that it is practiced only by an ever shrinking group of hobbiests, devoted tho they may be. Now, I admit ignorance of new written tests, but the General-level test I took to get my tech license back in 78 was so simple any housewife could pass it - I know, mine did - so I'd humbly suggest that a more difficult test with more emphasis on emergency operating procedures would go a lot farther toward producing a pool of skilled operators than our habitual dependence on code; a mode that nobody else uses any more. Certainly, a bit of effort should be needed, but it otta be directed toward something more useful than fun and games. My $0.02; and now I gonna drop this thread on this NG - If any want to go on lets "qsy" to rec. ... .policy. 73s KA3DWW ... til recently /AG.

Randy my boy, welcome to the world of Icom America!

For Years it has been Icom's policy of selling stripped-down radio
gear, both HF and VHF/UHF. Icom will let you have a bargain
on the base radio, but if you need that Narrow CW Filter, 10-Meter
FM module, "extra-stable" TCXO (is the one they give you first
time around a piece of crap?) or Tone encode/decode board - then
BE PREPARED to pay an obscene inflated price. I made the mistake
of purchasing a IC-28A a number of years back. Turns out the
much required PL tone board was an "Icom Option". It cost me $83.56
from a rather "well-known" ham dealership that runs full-page Ad's in
QST. PC Board had all of one SMT IC on it, plus a few chip-resistors.
It probably cost them no more than $8.00 to build. Buy an Icom radio?
I would rather peruse the local friendly pre-owned automobile dealership
4 miles down the road, they are more honest and reasonable than Icom.

Icom = PHOOEY!

That is the best summation of the current "decline = death" of amateur
radio as we have known it. Hanging on to a old mode of communication
to "test" someone is like pulling a record player out of the
Smithsonian and ask a current 10 year old to learn how to use it. I
mean, if they can use a record player the CD should be a breeze right?
:)

Give me a break, drop the code all together and make the tests like
200 questions about all phases, electronic theory, propogation,
emergency communications, courtesy, repair techniques, etc. Then you
will have a pool of trained people that will work in todays world!
Not WWII era!

Pacific Bell does not require their current field techs to learn how
to repair ROTARY phones!

I would rather them have proficiency in APRS or something that
although dated by even todays standards is closer to the "real" world.

It takes more to learn the encoding schemes of a packet transmission
protocol than the entire Morse Code alphabet!

Ken Harvey

659. Software for Icom's IC-R8500?

Steve;

I bought an AV-620 SN-001 (little brother to the AV-640) when
first intro'd. and quality is very good. Performance is good as
well for this type of multi-band antenna.
The Teflon loading coil for 40m on the AV-640 is a big plus in
my opinion. It should hold up under legal limit power FB.

Good luck
Jim, K4SQR

I don't know about the '9 ot of 10', but in general,
I have to agree.

> You can tell this by just listening to the poor quality of
> their signal and how they splatter all over the band!
> More is not better!

I agree, to an extent. It is also true that
'Less is not better!', still a case of when, where, and
why.
These broad, sweeping statements are just so easy to
refute, it almsot isn't any fun....

Please don't blame my teachers for poor English. They were too busy with diversity programs, liberal agendas, social programs, Union activities, and working to insure hefty salary increases coupled with excellent retirement benefits. Unfortunately, with the short school day and abbreviated school year, the teachers just didn't have the time to teach the three R's.

Tom, That better be well under a $1,000; more like $700/800. The 850 has an excellent reputation however I do not like the idea that it has a separate power supply. Prefer one that is built in so I opt for the TS940S instead. 73 Murray, K3BEQ

Messrs. Kennedy, "BMF" and Carl,

Thank you. We now have a little insight into the calibre of "new
operator" we can expect.
Yes sir, Herr Kennedy, sir. I will certainly work on my compositional
skills and sense of humor.
Since you obviously want to take off the gloves, why don't you have a
degree in something less sissified than "fine arts?"
BMF and Carl, your comments were just plain stupid and "the life" that
you say I need to get does not allow me enough time to respond to bonehead
comments. I guess in your pathetic little world having an opinion
constitutes one's need to "get a life."
Geez...

Source record: 77723

>If your heavy into contesting and DX work the MP may be the rig for you,
>simply because of the optional filtering capabilities it has available.

The MP has 2 receivers. You can hear them both simultaneously, one in
one earphone, and one in the other. Or both in both ears,
independently adjustable.)
2nd receiver is independently tunable (You can set freq of 2nd
receiver while you are listening to 1st one).
I am going from memory now, so I hope I am right but you can check
into it to be sure:
Built in switching power supply.
5 quick memory bank (920 probably has this too)
Synchronous detector on AM
Independently selectable filters in high and low IF
Independently selectable upper or lower sideband selection when tuning
CW.
Separate receive antenna input (for a beverage).
Two antenna inputs, and the memories remember which you use on ea
band.

668. FA: Keypad for Collins KWM-380

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-09 00:00:00 UTC
From: jbr101@my-deja.com
Message-ID: <8hrvem$p5q$1@nnrp1.deja.com>
Source record: 77724
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

I have a keypad for the Collins KWM-380 for auction on eBay.

The URL is

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=349728588

and the description is

This is a mint-condition keypad for the Collins KWM-380 HF
transceiver.When used with the interface board in your radio, enables
direct frequency entry from the keypad, storage of displayed frequency
into one of 10 memories, recall of frequencies stored in memory, and
"stepping through the frequencies stored in memory. The stepping feature
is especially nice for contesting. This is a heavy metal brute, weighs
around two pounds and is mounted on a rubber slab so it stays put on
your operating table. Comes with documentation, cable and connector
all ready to plug into your '380 and go. This is in like-new condition,
owned by a non-smoker who rarely used it. I honestly don't think you
could tell it from new. The last time I saw a KWM-380 keypad
advertised retail it was close to $300, starting bid is about 1/6 of
that; I don't even know if they're still available anywhere else but
right here on good ol' eBay.

Closes 6/11/00.

Thank-you

Sent via Deja.com http://www.deja.com/
Before you buy.

VERN

You must be that hick 'Vern' from TV, right?

My degree is even "sissy-er(?)" than you think. It's in Stage Lighting Design & Technical Direction. Should that be insufficiently butch for you I have several others: A lesser degree in Electrical Engineering (power) and an even lesser one (AA) in Architectural Engineering.. Sorry I'm not manly enough for you, Vern. I know you like them rough. As a great coincidence, I'm also from San Francisco...say something....go ahead you cracker.

By the way...what a totally ladylike email address you have. Love it!! Please check my spelling again Vern. It's important to me to please you.

In another NG, I was described as an "IRA loving " (true) "guiness swilling paddy" (unfortunately not so true)...So you are, in comparison, quite a pussy. How's that for appropriate usage.

skennedy
sissy guiness swilling paddy who actually went to college.

"Kiss my ass. I bought a boat. I'm goin' out to sea." TONTO

Well, you might look and see what filters International Radio has for
the 707 -- their filters are a little better, and I think, a little
cheaper than what the big rig makers charge. (They have a web site.)

Howdy all,
I recently acquired a Signal Crafters Model 30 automatic computing swr/power meter. What I did not get was the remote sensor units or a manual. Does ANYONE have any idea where I can get the info on these units? It is not beyond my capabilities to build them from scratch if I had the plans. Need remotes to cover 6, 2 and 70 for a definate, other bands would be a plus. Also, if anyone has the owners/operating manual, let me know, I would definatly like to get a copy of it.

Thanks in advance

Shawn

678. Re: Linear Question 10 meter HAM use/Legal or NOT?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-09 00:00:00 UTC
From: Gary B <garbre@sisna.com>
Message-ID: <39410e52_3@news.sisna.com>
Source record: 77734
Cross-posted to: rec.radio.cb,rec.radio.amateur.equipment

Situation:

10 meter use by a licensed ham. "CB" linear (Palomar, Texas Star, etc)
Is it legal or not for a licensed ham to use one of these "CB" linears on
10m?
Driven by an HTX-100 or other "Type approved" 10m transceiver.

Gary K7MHZ

----- Original Message -----
From: Radiskull <Radiskull@usa.com>

> you idiot. CB Linears on 10 meters is Illegal.

Wrong! first what is a CB LINEAR???? typically a couple of transistors
with broadband i/o circuit, possibly more transistors using i/o
combiners.... Per FCC rules and regulations i'm allowed to make and sell
these amps, I believe the legal number is two per year, I'm also allowed by
law, to run UP TO 1500 watts. My mobile will run full legal limit on 10-160
my amp is a rebuilt solid state CB amp it is clean and DOES not splatter!
Just because i have it does not mean i use it, i very seldom throw the
switch! You sir are not only a POMPASS A$$, but an ignorant one at that!
I doubt your even a real HAM, and if you truly are I'm ashamed of you!
You've truly lost the spirit of amateur radio! But perhaps your just one
of those fellows who enjoys QRM'ing evryone!

You ignore FCC regulations
> and laws on 10 meters doesn't show that you will abide by any law or
> regulation on any other band

I ignore nothing!!! Again you are simply ignorant!!!!

-- why bother with the flames? you KNOW that we
> all Know what cloth you are cut from -- crawl back into your own sewer.
> 10-4.
>

Do tell, What cloth is that??? If you were representative of a
typical HAM i would be ashamed to be cut from your cloth!!

> and it is pompass ASS you bloody arse!
>
>

Politeness and integrity prevented me from using your version! something
you probably know little about!

You are quite simply an ignorant person who wishes to be in the
limelight, lacking any real communications skills you are simply venting
your frustration on the NG....

There is absolutely nothing wrong with the vast majority of CB
operators, just like Ham radio CB has its "Radiskulls" should be
"Numbskull" You and like minded people are the typical reason why MANY CB
operators will NEVER becom Hams!!! Now i'm sure your first thought, or

response will be "GOOD" however many CBers would be a great asset to
Amateur radio, and i would glady take 10 of them for every "RADISKULL" on
the Ham bands!!

Have a nice weekend!

680. IC-756PRO wish list

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-09 00:00:00 UTC
From: Kevin McWilliams <kevinm@ccsi.com>
Message-ID: <3941CB37.2231339@ccsi.com>
Source record: 77736

Here's my 756PRO wish list. I've been in ham radio for 38 years and
have designed receivers for the last 22 years. I've owned a 756 with
the
TCXO for about 2.5 years. I'm not going to list the good points
(there are many), either operational or technical.

Wish list:

1) higher 3rd order DR
2) lower NF with preamp off
3) (probably) better preamp Ito
4) better blocking DR
5) better IF rejection
6) better image rejection
7) better frequency accuracy - the unit was off about 15 Hz. My 756
with
TCXO is off about 2-3 Hz max
8) get rid of CW make clicks
9) eliminate rumble at wider BW's
10) eliminate transient in-band IMD

All in all, this one isn't ready for prime time on CW. There are lots
of
operational changes that would be nice, too, but that's another story.
Any comments? Additions?

Source record: 77746

My 101E has quit transmitting.... I recently relocated and moved the unit. Prior to the move, it was working fine. It now receives great, but there is no transmit. The finals don't even light up. I noticed a little lamp fuse on the back of the unit. It does not light up. I don't know if it did before or not... Had no reason to really look. The manual indicates it protects rf amplifiers against ,"strong local signals". Questions are:
1) Should the fuse light up?
2) Does this lamp fuse control power to the finals?
3) If the answer to both above is yes.... Where can I get one?

Tnx
Bu

The 20 amp supply should work most of the
time. The unit will peak on 22amps on the
voice peaks. I would go for a screwdriver
antenna and put it on a railing on a outside
balcany. They are motor controlled and
require no tuner. They work from 80 to 10
meters. You will have to put out some sort of
simple ground plain. You could even use metal
screen to do it. Here is one that I suggest:

http://www.tjantenna.com/

Good luck

Which reminds me...All manufacturers have the occasional lemon.
I had some brand new name batteries leak their insides (in one week) into my
Airmap 195 GPS which at that time cost well over a thousand...Now they are
much cheaper. Ok, so they are some what cheaper.

Roger (K8RI)

688. Program GE w/Motorola RIB?

Larry why bother cross posting your sarcastic crap to the CB newsgroup??
The linear itself is not illegal, using it on 11 meters would be illegal, He never said he was using it on 11, for all you know it may have been a legitimate question from a legitimate Amateur operator.....

Toko makes little helical bandpass filters for 2m and 70 cms. They are
quite cheap. You could try mounting one of these in a small diecast box
with BNC connectors on it.

yep, the PAR filter is the way to go. I also use the mobile version and
it works wonders. The HT version should work great for you.

I use a CB linear on 10 meters, so what does that prove??? you insinuate
because i post in a cb group and use a colorfull name that i'm not a ham or
i'm someone that crawled into HF because of the restructuring?? Got news
for you, i happen to hold an Extra class ticket and i even did my 20 wpm!
so blow it out your POMPASS ARSE! Your mentality is the main reason such
drastic measures were taken regarding restructuring. You think because your
a ham your better the average Joe. your attitude drives off new and
potential Hams! why criticize every move? why not Attempt encouragement?
My mistake, you have no intention of being a HUMAN BEING! Your just
another DAMN TROLL

When Hams come to realize they are no better than
any other group of radio Hobbyists then, and only then
is there a possibility of saving the Amateur Radio spectrum
from commercial interests! Good folks disregard this post!
you holier than thou Stuffed shirts get off your high horses

since signals on FM are usually quite strong, it is sometimes an
improvement to put an attenuator in the front, you probably don't need
the power, so it could be used for transmit as well

we have 100W RF pagers on 148.050 and 148.100, but the worst problem
wasn't blocking, but transmitter noise spectrum, so the manufacturer
had to modify the power amplifier (better decoupling) to improve on
this

I appreciate everybody's input on this one...

The car's A/C no longer works and its not worth fixing. I've also seen that the interior of the center console stays warm for a long time after the windows have been opened and the car has been driven (seems to be some sort of insulation factor here). I just place my hand inside the storage pocket and feel the top and bottom. On a hot day, both the top and bottom are warmer than anything else in the car even when the stereo is off and the car has been driven for 45 minutes.

Based on this, I don't feel that there is enough circulation in the console to dissipate the heat from the rig's heatsink. A fan may work. But, once we get to this point things are getting a little to complex for my liking. With respect to the stereo and its power. I've found that many manufacturers rate the amplifiers in the head units as 'peak' -- which infers that the average value is much lower. I've got about 24 watts in the head (driving the front speakers) and about the same in a small external amp driving the rear speakers -- both get luke warm during normal operation. I've heard that the IC-2100H gets fryer hot during operation. Even the manual warns you about it.

So, under the dash she goes in this car. And, I can go through the same thing in an another year or so when I get rid of this car for another.

Thanks all, Michael N9BDF

For sale or trade:

Atlas 210X solid-state HF mobile rig. Very compact size (only weighs 7 pounds). Covers 80/40/20/15/10 meters, SSB and CW. Analog dial. This is a late 1970s rig that is 100% solid-state and runs on 13.8 VDC at up to 20 Amps. May need some work. Transmitter works fine on all bands; power output is 100W plus on 80m through 20m, about 80W on 15m, and about 50W on 10m, and I'm told this is correct for a 210X. Receiver sensitivity doesn't appear to be what it should on 80m and on 20m thru 10m, but 40m is strong. Rig is clean, with minor usage wear on the front panel and the cabinet, but not serious at all. It's a good looking set. Original hand mic (Shure Bros. 404) is included and is in great shape. A Cerlox-bound reprint manual, enlarged to 8.5" x 11", is included. This is a complete manual that includes operating instructions, service information, info on Atlas accessories, also contains some ads, spec sheets, and so on. I bought the rig with the intention of using it mobile, but I got a great deal on a used Alinco DX-70, so this one went on a shelf. Now, it's gotta go. I have $170 invested in it, and I'd like to get that back out of it if possible. In trade, I'd be interested in trading toward a Drake T-4XC transmitter with AC-4 p/s (of course, I'll make up the difference in cash). Interested?

On the TS-570 there is a little "lever" under the dial that adjusts the
drag. TS-870 may be the same.

I don't read CB newsgroups -- this was posted in ALT.REC.AMATEURE.EQUIPMENT

you idiot. CB Linears on 10 meters is Illegal. You ignore FCC regulations
and laws on 10 meters doesn't show that you will abide by any law or
regulation on any other band -- why bother with the flames? you KNOW that we
all Know what cloth you are cut from -- crawl back into your own sewer.
10-4.

and it is pompass ASS you bloody arse!

Hello, I'm looking for a set of crystals that will fit a Regency
HR-2B.

The local repeater is at 147.135 + , I believe that means I need one
at 147.135 and one at 147.735.

If anyone is looking for other 2 meter crystals, I now have some I
might be willing to part with.

Any help will be greatly appreciated, I'm a brand new ham and this is
my first try at finding parts...

Thanks!

This is supposed to be an entry level radio, but the accessory prices on some items are amazing. A CW filter for a 706 is around 75.00 - 100.00. One for the 707 is almost 200.00? The filters have a different IF frequency granted (9.0 Mhz = 706, 455 Khz = 707). Other than greed and the 455 might be somewhat more expensive to manufacture other than greed is there a reason?

Randy

Since when would a "CB" linear used on the 10 meter band by a licensed
ham be illegal?

NOT! It's illegal to SELL 10/11 meter amps. It's quite legal for a ham
to use one though. A ham can use anything as long as his signal is clean
and legal power. He could even build it him or herself. My henry 2k is
quite legal on 10m even though it wasn't sold to operate on that band
without modification. MK

I am 27 years of age, I do own a cell phone and
don't even own a RF amp because I don't need
one. There isn't anywhere in world I cannot
communicate with on 100 watts or less and simple
wire antennas. It is the narrow-minded people
who think they need 2KW amps and large beams
to communicate with another station! Even when the
sunspot cycle was at it's worse, using CW I could still
communicate with Japan using 100 watts or less and
a simple wire antenna. 9 out of 10 people using a
RF amp don't know even how to use it properly.
You can tell this by just listening to the poor quality of
their signal and how they splatter all over the band!
More is not better!

David from VA.

Hello All,

Can anyone explain to me about using a "transverter" with the FT-1000MP? I am unaware of this process of using a transverter for 2m, 6m, 440mhz? Does this allow you to tx and rx on VHF/UHF with the FT-1000MP? How does this transverter attact to the FT-1000MP and where do you get one? I assume this is a external option?

Thanks

Jason S. Hulet

They are almost certainly illegal to be sold, but that's another
problem.
Legal, as long as the amp is reasonably clean.
We are expected to maintain some spectral purity. Specs are in the
handbook.
There are a few rules that come into play if you sell them,
but you can use anything you have, and can buy anything you can
afford.

Source record: 77608

Does anyone know whatthe differences are betwen these 2 rigs? I understand the 580E is the European version, and is only setup to transmit from 144-146 mhz. I am wondering if the "mod" to open transmit on these radios would restore the entire US 2 mtr band to this rig? Any other differences that would make this radio difficult to use in US/
Thanks
Mike AB7RU

Message-ID: <8hu02b$3k7$1@nnrp1.deja.com>
Source record: 77616

The ALINCO Model DR-599T is a dual band transceiver

The independent main band and sub-band operation permits
full duplex operation, w/crossband repeat abilities.
offers 30 memory channels (15 per band), high/low power,
four scanning functions, full reverse operation at a touch,
priority, call and ABX functions. The 37 selectable sub-audible
encode tone frequencies can be called for encode or
encode/decode (tone squelch CTCSS) decode optional.
Detachable front panel is easy to read and understand.
The LCD lets the operator know at a glance which functions
are in operation. Beep and bell tones can be added or deleted
as desired.

Thats about it in a nut shell. Comes with manual,
power cable and mobile mounting bracket, duplexer,
Air band rx and full 800 Mhz coverage w/ antenna connection.
$265 shipped.

Thanks
AL

>
>Gary K7MHZ

No amateur transceivers are Type Accepted, they aren't required to
be (though *receivers* operating above 30 MHz must be Type Certified,
a different thing). But external linear power amplifiers for use on HF
have to be Type Accepted in order to be legally manufactured, imported,
or sold in the US.

So a Palomar, Texas Star, etc is thus contraband because none of
them are Type Accepted amplifiers (and can't qualify to be Type
Accepted because they exhibit power gain with less than 65 watts
input drive). The FCC considers possession of such contraband
prima facie evidence of illegal activity. They will confiscate it and
destroy it if they happen to find you in possession of it.

Now an amateur can *build* an external power amplifier (no more
than one of a given design per year), and that amp doesn't have to
be Type Accepted, though it does have to meet spectral purity limits.
So you could consider the Palomar a box of parts from which you
build an amp, and sneak in under this subsection of the rules
(provided you actually do some modification or assembly, which
you'll have to do to make it meet spectral purity limits). You
should be ready to prove that, though, if you have an encounter
with the FCC. Having an amateur license doesn't automatically
give you a blank check to possess or use contraband equipment.

761. Maryland Hamfest - 18 June

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-10 00:00:00 UTC
From: windbrkr@erols.com
Message-ID: <MPG.13ac3aaa5385d43798975d@news.erols.com>
Source record: 77620

The Frederick Amateur Radio Club (FARC) presents the annual
Father's Day Hamfest on Sunday, June 18, 2000
from 8:00am to 3:00pm, rain or shine.
(Access for tailgaters opens at 6:00am)

It's at the Frederick County Fairgrounds on East Patrick Street in
historic Frederick, Maryland. Easy access from I-70, I-270, US-15, US-
40, etc. Plenty of parking.

Talk-in on the 147.060(+) MADRA repeater.

We'll have Radios, Electronics, Computers, Acres of Tailgating,
Indoor Commercial Vendors, VE Testing and more.

Good food and refreshments available.

On the web go to http://www.qsl.net/k3erm/ for more info and a map.

General admission is a $5.00 donation.
Tailgating spaces are $5.00 each + general admission
Indoor tables are $10.00 each before June 10th, $15.00 after.

One of the largest and most popular hamfests in the
Baltimore/Washington metro area. Don't miss it!

Questions? E-mail k3erm@qsl.net or direct to me

Thanks & 73,
Bob K9CMR

I think your post might have more credibility if you knew how to spell
"amateur".

Note, I've been a supporter of restructuring for 32 years (ever since
that atrocity called Incentive Licensing was imposed). It has never
made sense to require different tests to gain privileges in adjacent
segments of like spectrum using like modes and like power levels.
Either one is qualified to operate HF, or one is not. One license class
is necessary and sufficient to determine that. The new rules still
haven't properly addressed that.

(It is fair to argue at what level of technical competence that testing
might be set. My personal feeling is that the current General level is
too low, but I have a somewhat open mind on that subject.)

I think an argument can be made today for considering totally abolishing
manual Morse speed testing, though quite frankly 5 WPM isn't a real barrier.
You can write down the dots and dashes and translate on the fly at that
speed.

Under the new rules, the Morse test is no longer a real deterrent to anyone
seeking a HF license. I'd note that the upgrades to General under the
new plan have been very brisk. I don't think that we can seriously say that
Morse testing is "killing" amateur radio anymore. We are seeing real growth
in more than just the Tech class now. The fact that a Morse test still exists
does give us a bit of an image problem, ie as a backward radio service, but
I don't think that's a totally insurmountable obstacle to recruitment.

The very fact that some hams do still use Morse on HF is a somewhat
compelling reason for all hams to retain some familiarity with it for the
purpose of recognizing and mitigating mutual interference between stations
using Morse and stations using other modes.

A manual speed test may not be necessary in order to do that. A capability
to do machine decoding may be sufficient. This isn't so outre, in times past
amateurs were required to maintain an independent capability at their stations
to measure the frequency and power of their emissions other than with the
indicators on their transmitters. A requirement to maintain a capability to at
least minimally decode Morse, either manually or mechanically, isn't so
radical.

It also seems reasonable, however, that stations using Morse should have a familiarity with the other modes with whom they share the spectrum, and be able to at least minimally decode those modes in order to recognize situations where they may be posing an interference problem for those operators. It should cut both ways.

When there was only Morse and analog voice, things were a bit simpler. But today we have a number of other modes sharing spectrum, and a qualified amateur should be able to recognize and coexist with any of them.

Hi Don,
Starting out with a QRP radio has worked well for me. I thought that I would move from 40M novice to 20M advanced to SSB. After operating for a while and considering QRM, QRN, SSB traffic, antennas, my code speed and my interest in DX, I like 15M CW the best. Glad I didn't sink megabucks into a DC to daylight superradio. If you get a fair price on a classic like a Heathkit HW-8 or HW-9 or a Yaesu FT-7, you will probably be able to sell it for what you paid. Or keep it for camping. I will get a 100W radio someday but now I have time to watch the market and watch for answers to questions like yours. Thanks everyone.

The 850 has one of the very best receivers ever made. Look at the QST reviews and compare its sensitivity and dynamic range to its competitors in any price class. I own an 850 and a 1000MP. Before I did the INRAD receiver mods on my MP, the 850 receiver beat it! A clean 850 is a keeper. 73, K7JY.

Ok , you want to run a 2970 into a texas star 350 hdv, ? right ???
yes you can ! wacth you dead key keep it low around 3- 5 wats ,, I
KNOW IT'S A HIGH DRIVE!!! but you will get more out of it (all boxxes
for that matter) putn yo a swing kit in (not the one you buy!!!!)
you'r 2970 is very capable of swinging up to 250 wats itself
but you can drive that modulation thru the 350 hdv
IF YOU KEEP YOU"RB DEAD KEY TO AROUND 3-5 WATS!!!!!!
AND YOU HAVE THE RIGHT SWING KIT IN YOU'R RADIO !!!!!
As for what you should see in the way of out put ?? 600-800 wats swing
on you'r 350 hdv , with a dead key of around 100 wats or so
GOOD LUCK !! MOPAR

> and amplification level.....

In order to use any commercial 160m-15m HF amp on 10m, you have to "homebrew" the 10m section to enable it to operate. If you had to buy parts for this, I imagine the company would want to see proof of a ticket. There are NO amps legally sold for use from 24 to 35 mhz. Period. There are NO amps sold for use below 144 mhz that are not "certified" in the fcc database. Except for 1 a year that a ham can make and sell if he wants. A non ham can not build and sell an amp that operate below 144 mhz without certification. Period. There is no "type acceptance" for external power amps anymore. I can read part 97 quite well. Should I go on? MK

My first shack, back in the 1970s, was in the basement of my parents' house on a folding metal table in a corner. Not a glamourous setup, but functional.

Every shack I've had since I moved out in 1980 has been in a spare bedroom, first in a two-bedroom apartment, and then in three-bedroom houses. My current shack is in a 12 x 14 foot bedroom upstairs. I also have a permanent HF and 2m FM setup in my 1998 Ford F-150 XLT extended cab pickup truck.

Hi,
I have the following amplifier": TPL model 7010.

This is a solid state, commerical amplifier capable of 80W carrier, 200W PEP
output in the 21.0-30.0 Mhz range. This was built in the pre-ban on
amplifiers capable of amplifying signals at the 27 Mhz range. Uses
3x SRF712 Motorola transistors in class AB config.

The amp has a multi pin connector plug -- presumably it is used to
change the mode of operation (SSB versus carrier T/R relay), pre-amp,
and power. Anyone know how to configure this amp for SSB service? Or,
other instructions on this amp????

thanks,
Joe

From: Roger Halstead <rdhalste@tm.net>
Message-ID: <3%815.2421$GY3.301472@newshog.newsread.com>
Source record: 77641

Is there any way to eliminate the 147 MHz signal from the computer is the Dodge, Plymouth, or Chryslers using the Optional/larger V-6?

I had planned on purchasing one, a couple of years back, before I discovered the strong signal which can be full scale on the S meter up to a quarter block away.

I worked with two dealers to pinpoint the problem and we found that had the cars been setting for a while, they would be quiet. Start them and they had a tremendous signal on 147.00. Shut the engine down and the signal remained. They removed the battery lead and the signal was gone. Then they put the battery lead back and disconnected the computer...Again the signal was gone.

I hasten to add that I've not checked any of this years models out, but I'm curious as to whether they fixed the problem.

Having one of these things pull up along side while working 147 will over ride the repeater if you are much more than three or four miles away.

This sounds like something where a complaint could be made that they
violate part 15 emissions requirements.
If the FCC confirms, that would likely force a recall/TSB.

Source record: 77646

I'm in contact with a Texas prison inmate who has asked me to help him sell a military surplus receiver and some other assorted electronic and photographic equipment.

From the rough sketch he included, I think the set may be a BC-348 or possibly its BC-224 predecessor. Apparently the ID tag has been removed from the set..

The money is urgently needed for the prisoner's legal defense fund.

The equipment can be viewed at the home of this person's parents in northeast Texas (60 miles southwest of Texarkana; 20 miles east of Mount Pleasant; 50 miles north of Longview).

Anyone who might be in a position to visit the parents and appraise/purchase the equipment should contact me directly; I'll then provide you with the phone number
so that you can set up an appointment.

Dave,
I bought a 949E. Worked fine for 2 months, now the SWR/PWR meter
is not reading correctly. Nothing I did I am pretty sure. I emailed
MFJ, no answer. I hear reports of 3-6 months on warranty service.

So, if you get MFJ... Figure on being your own warranty repairman
and figure on doing that too. Mighty Fine Junk. From what I hear,
there are a lot of better tuner choices out there.... Keep looking.

Hi Gang,
Many thanks for your comments on my webpage on the new Yaesu Mark V/ FT1000MP. I've now had a chance to do some on-the-air comparisons between the new Yaesu and the Icom 756-Pro. I added some of the results to my web page at http://www.muohio.edu/~4cx250b/web/markv.htm
Your comments and suggestions would be most welcomed.

73,

Jim W8ZR

Where? JWACS doesn't use it. NTDS doesn't use it. TADLs don't use it. Air controllers don't use it. SEALS? Maybe, in an emergency. Who else (be specific)?

> Along with my extra class ham license, I also hold a
> first class radiotelegraph commercial license.
> CW is still in use in the commercial communication sector.

Where? Ships quit using it years ago; aircraft before that. Big corporations? I doubt it but I'm ready to learn. Does the FCC even issue Radiotelegraph licenses any more?

> It is only the lazy, give me a ham license without
> working for it class of people that think CW is worthless.
>

Could be, but I see it quite differently. The spectrum belongs to us all jointly, and is managed by the government just as public lands are managed. The portion allocated to
Amateur Radio is essentially set aside for recreation - not just yours but everyones - and while it is entirely reasonable to set standards for using this and other public property, those standards ought to be reasonable. Now, suppose you decided to go up on the Blue Ridge Parkway to try some VHF DX but were turned back because you couldn't start a fire with two sticks within some prescribed time. You'd prolly call that unreasonable. After all, everybody except a few hobbiests use bic's these days ... and you'd be right! The same applies to code and, IMHO, selfish SOBs like yourself have used it to deny the rest of us use of "property" that is, after all, ours as much as it is yours, for far too long.

LOL, A real Ham? You certainly represent The Holier than Thou Stuffed shirt Attitude!! A real Ham would NOT make the statement you just did!! Most of the Local hams around me all started in CB and some still retain there complete stations with Amplifiers et all..... CB is a stepping stone for some on the way to becoming Amateurs! That is unless they run into a Ham who thinks he is better, calls him a CHICKENBANDER and generally cuts down on his hobby!

GET A LIFE! use your knowledge to better Amateur radio. not to see how many CBers you can KNOCK!

Lordy -- you need to contact CNN -- holler at Dan Rather. Imagine, a
Texas prison inmate convicted, most likely, whilst employing drunken,
half-asleep lawyers, it selling boatanchors to get his legal defense
fund a'going. Is G.Bush Jr. insisting his conviction is on the up and
up?

Sorry for the humor, but couldn't resist...

Actually, if you were to forward your post to Barnard Shaw at CNN, or
Geraldo Rivera at MSNBC, you might make national news.

817. Re: Yaesu Mark V/ FT-1000MP versus IC-756 PRO

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-12 00:00:00 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <3Ed15.15058$hp4.425037@newsread1.prod.itd.earthlink.net>
Source record: 77668

I read your info on the 756 Pro - interesting. The 756 Pro would appear to come in second not only to the FT-1000MP MK V, but also to many other transceivers of years past. Even my Yaesu FT-900 has better numbers for MDS, BDR, IMDDR. Those with far better numbers include: Icom 756 (original), IC-765, IC-775DSP, IC-781, TS-850S, TS-950SD, Omni V, Omni VI, Paragon, FT-920, etc. Can't argue with someone buying a 756 Pro because because he WANTs one, but if top performance were the criteria, there are plenty of other options in the second-hand market for a lot less money. Will the novelty of the DSP I.F. and built-in band display win out anyway?

So, when I look at a recent, preliminary ad for the Icom IC-756PRO,
and the fine print says:

"This device has not been approved by the Federal Communications
Commission. This device may not be sold or leased, or be offered for
sale or lease, until approval of the FCC has been obtained."

What the heck, exactly, is it, that the FCC is "approving"?

A TSB might be put out describing the problem with possible remedies, but I wouldn't count on a recall unless you can convince the gov't that it's a safety issue. Lets face facts, hams aren't in the majority and not everyone drives a Chrysler product while using 147MHz. The guy will probably be forced to live with it. Sort of like us Ford owners with noisy fuel pumps. =(

I am looking for a B coil for a HRO. The older stlye with handles is
preferred but I can use a
later type if I have to. Might by a junker HRO if it had a set of coils
and was priced right.

I have lots of BA stuff to trade if you prefer, tr relays, tubes,
meters, phones, mikes....

Thanks

George

>resistor all up.

The resistor is a mineral that is likely still good. There is no metal
in it that might corrode. The ends, however, were metalized and I
suppose this might have disappeared. Still, if you clean it up and put
it back together with the right oil you will probably be fine. It is
more likely that the metal straps bolted around the ends of the
resistor are corroded and now don't make good contact. Clean them up.

>Does anyone have a replacement or know where to find one?

I think that Stackpole actually made these for Heath and I used to
have a couple of spares somewhere on my desk. Email me if cleaning
doesn't work.

Use your VOM to measure the resistance of the bare resistor. I think
you'll still get close to 50 Ohms.

Please respond via Email and not to the list....thanks..

I have a "whole slew" of 7/8" hardline (multiple 125 foot lengths - around 7 of them, I think, most with "N" connectors on both ends).

I also have 110 feet of Rohn 25G - 10 sections, and a top section.

I also have a 75 Mhz 3 el yagi, and 3 Super Station Masters in the 156-161 range.

What's this stuff worth, so I can start selling it. I'm in the Atlanta, Georgia area.

Thanks

John, n4tii

834. Thinking of becoming a Amateur Radio operator....

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-13 00:00:00 UTC
From: Scott Bowen <scott.m.bowen1@jsc.nasa.gov>
Message-ID: <8i66pc$mse@niven.ksc.nasa.gov>
Source record: 77497

Hi all,

I am seriously considering becoming a Ham Radio operator.
I was planning to get my Tech No-code and work my way up from there.

My only problem is, after reading some of the posts about No-code operators, my concerns about becoming a Ham are now feeling so good.

The thread about "No intelligent people to talk to" is pretty much a direct slam on the No-Code license operators.

Why is that?

I have keeping track of this newsgroup to try to learn something about the hobby, but I see quite a few negative comments about the entry level licenses.

Scott

[who will probably get flamed and get his e-mail picked up by numerous porn sites and spammers]

835. Re: Amateurs must be stupid if ham radio is to survive.

Newsgroup: rec.radio.amateur.equipment

The post is begging the question. Just because standards change to attract new operators, it does not follow that the new lot of operators are less intelligent and needed the chage in standards to pass the ham tests as they were.

There are many competing forms of communication that appeal to the pool of potential hams. Change may draw some into the hobby who otherwise would not take a second look.

wrote:
>
>Call the FCC and ask them. We did.
>

I am sorry, I thought asking questions of VE's and other more
experienced hams was a part of amateur radio. I see I was mistaken,
and will take future questions to the FCC.

I passed the code test by writing dont's& dashes and then decoding it.
I then answered the 10 questions in the VEC test, scoring 10 out of 10
correct. My test as well as my scratch paper were both sent to the
FCC, and the current FCC database shows me as a General, so I guess
this was acceptable.

It does not seem fair & equitable to me that different VE teams are
allowed to interpret rules differently, and that was really the point
of my question. I suppose me expecting VE's to be fair and eqitable is
another example of my new ham naivete, like expecting VE's to answer
questions.

Well, we all had entry-level licenses at one time.

If you like messing with radios, get your license. Ignore the contrary
coots. For every one you run into on this newsgroup, there's a dozen
operators who are much more friendly to new licensees.

This hobby has always had a few jerks. But most hams are good guys --
and gals...

Sure, why not.

> My only problem is, after reading some of the posts about

> operators. Why is that?

Possibly because "the code" has always been a [major] part
of the tradition, and coincidentally a "measure" of
committment of the prospective newcomer.

Some Hams seem to even think in Morse, others mastered
it once [for the license level they wanted] and probably
forgot since... Still, it is part of the tradition...

But the bitterness towards the *tradition* "adulteration"
isn't necessarily spread towards the newcomers who happen
to benefit from the change. So expect plenty of folks to
welcome you without reservations. Also expect some to
reject you. [What else is new?]

> I have keeping track of this newsgroup to try to learn
> something about the hobby, but I see quite a few negative
> comments about the entry level licenses.

Some people can't take that they had to pass through
certain hardships, and others "get off easy". Like
"if you weren't hazed, you aren't a real 'trooper".
Some just dislike abandoning the tradition. And
some, well, are less than nice...

Scott -

There are a lot of negative people who hang out on these news groups
who seem to delight in making others miserable. The best advice is to
just ignore the negative comments, get your license, and enjoy the
privileges it brings you. Find a local radio club. You will find
lots of help there. Good luck in your new hobby.

I dare say that some of the newer 20wpm extras could not have passed the old test where you had to find a FCC field office and take it in front of an FCC examiner, and damn near have enough knowledge to build a radio to pass the novice test. For every ham that will harbor ill will toward a new ham that did not have to pass all the elements that they had to pass, there will be 10,000 that will welcome you to the hobby.
Like Nike says, just DO IT.

I think there is also the issue of a newcomer possibly feeling intimidated by talking into a radio for the first time(s), and knowing that there may be many others listening. "Those many" might not be all that interested in talking to someone who is fumbling through, not knowing all the lingo and having developed a smooth style. ;^) All levels of license class can be found monitoring any given repeater.

Compare this to Novice operation that was Morse only, restricted to specific band segments where we were forced to learn the ropes, often among other Novices. By the time we learned 13WPM and could pass the written exam, our operating skills generally improved enough to "get on the phone bands" (if we so desired) and make some sense out of the language of ham radio.

The common advice, then, for first time no-coders is to listen, listen, listen.

Barry....I currently own an ADI 447 and find it to be a nifty radio for the money. I use mine totally in the shack and works well for a dedicated 440 rig. The backlit handmic is really nice and the radio is easy to program. The bonus of CTCSS and DCS, which are standard, are a real useful feature here in intermod city!!! One of only a few negatives would be the 447's lack of ability to monitor out of band. I have some 423 and 462 mhz public safety freqs programmed in scan and can barely hear them transmit with an exterior antenna. Another minus is the s-meter readings, which are quite erroneous. Most everything is "full-scale" as long as its a viable signal. I noticed this was the case with the ADI 147, which I also own. I guess this might be solved with some internal adjustment, which I have not gotten around to doing yet.

> K5JOE
> Joe in Little Rock, AR

G..I once saw a 20 wpm extra that had trouble dealing with changing a
tube in a old HW-101. License class means nothing about ability in the
real world. All a ticket means is you passed a minimum test to get the
ticket you want. The actual amount of information to be consumed on all
the different radio subjects will take a lifetime. And you still may not
be done yet. It's all the stuff you learn in the real world that counts.
Much of the stuff on the written tests have little to do with the real
world of operating radios, building antennas, etc.
I know for myself, I really haven't scratched the surface yet in much of
this stuff. And I'm sure there are quite a few professional-radio/ no
code hams who could eat me up on radio theory. As far as Scott, I
wouldn't worry about it. There are weirdo's in every crowd. Just ignore
them and do your thing. Heck, I was a novice for 7 years before I
upgraded to general. Didn't bother me at all. I actually like code, so
being stuck on the novice bands didn't really bother me. I don't
remember any hams chiding me to upgrade back then or giving me problems
about being a lowly novice. After a while, I upgraded to general mainly
because a friend of mine was upgrading to advanced, and I thought what
the heck...So I went with him and upgraded. The only reason I upgraded
to extra was to get a new call. My retention of theory, or my code speed
hasn't increased a bit due to this new ticket class. If anything, due to
lack of operating, my code is getting slower. So in that respect I was
actually better as a general...:(MK

Scott

Take the test, get your license, and get on the air with
real hams who do most of thier communicating on the radio. Get
with a local club and you'll find a lot of helpful folks who will
assist you in learning the tech and operating side of the hobby.

Determining the quality of amateur radio by the folks you
read hear is like determining the quality of the human race by
the folks in Central Park after midnight.

Modulation System: Variable reactance frequency modulation
Max. Frequency Deviation: ±5.0 kHz
Spurious Emissions: Less than -60 dB
Microphone Impedance: 600 ohms

RECEIVER
Receive System: Double conversion superheterodyne
Intermediate Frequencies:
VHF: 1st 17.2 MHz; 2nd 455 kHz
UHF: 1st 30.85 MHz; 2nd 455 kHz
Sensitivity: Less than 0.16 ΅V (typical) for 12 dB SINAD
Squelch sensitivity: 0.13 ΅V (at threshold)
Spurious and Image Rejection Ratio: More than 60 dB
Audio Output Power: More than 2.4 W at 10% distortion with an 8 ohms load.

This one is used but never abused (8+ easy). I bought it new four years ago and it has functioned exceptionally well ever since.

No mods have been applied

Reason for selling. Make room in the truck for the FT-100

$295.00 plus shipping if needed

I would assume no one at the FCC wasted time looking at your scratch
paper of dots and dashes.

Part 97 Rules state:

"97.503(a) A telegraphy exam shall be sufficient to prove that the
examinee has the ability to send correctly by hand and TO RECEIVE CORRECTLY BY
EAR texts in the international morse code at not less than the prescribed
speed, using all the letters of the alphabet, numerals 0-9, period, comma,
question mark, slant mark, and prosigns AR, BT, and SK."

By any legal definition, and by common sense, writing down dots and
dashes as you hear them, then translating these at more liesure into letters is
not demonstrating an ability to RECEIVE CORRECTLY BY EAR, let alone at the
correct speed.

Of course you can guess those written questions and know one will know if
you are only guessing, but to blatantly mark down a representation of sounds on
paper so you can go back to them later is certainly not meeting the
expectations of 97.503(a) and any VE with integrity won't allow it.

What?

You PUT ON THE HEADPHONES AND LISTEN TO THE CODE. Who cares if you write it down while YOU "RECEIVE IT CORRECTLY BY EAR" WITH THE HEADPHONES ON?
The test is five minutes long. Are you going to remember every word of the qso?
Whether you take a few minutes afterwards to look at your dots and dashes shouldn't matter.

It's not like you were given a piece of paper with the dots and dashes on it and asked to READ IT!

You have to LISTEN WITH YOUR EARS. Some people take a little longer to convert the tones to letters and writing it down helps. Do you remember ALL 100 items your wife asked you to get at the grocery store? No, you WRITE IT DOWN after you "CORRECTLY RECEIVED IT BY EAR".

Sounds like old farts that don't want new blood in the hobby, again.

Dan

I have a Kenwood G707A and I'm very happy with it. Scan speed seems to be about 0.5 seconds between channels (very slow if your use to a scanner). Out of band sensitivity seems to be good. I have performed three mods to my unit (found all on the net). The rig does recieve well in the 800-950 MHZ range but it does not scan between 866 +/- to 867.995 which is not in the cell range. THe local police dept in my area broadcasts in this range and I cant get it. Hope the info helps...Paul KD5KBX

This is an answer, at least in the sense that it defines where the
authority comes from.
As to it being a moot question, I don't see how.
The FCC defines the rules, and what it takes to obtain a licence.
Some parts of these rules and definitions are open to interpretation,
in that what exactly is compliant is unclear or not specified
(farnsworth for example).

So if I understand you properly, the ARRL has told the VEC teams that
they may accept it or not as they choose.
This creates a division in testing standards, and invites confusion
and debate. You can hardly make a move like that, and then snap at
people who question the percieved disparity that results.

As I understand the requirements, you are given a certain text to
copy, and some time afterward to "fill in any missed copy". HOW you
must arrive at this is never specified. If it is easier for you to
write out the dots and dashes, and then, looking at it, translate to
letters, I don't see the problem. If a VEC bounced me for this, I'd
be pissed, since it's within the rules and the spirit of the
requirement. (Granted you'll never work at any speed with this
approach, but that's not part of the requirements)

If someone were to simply hand in a string of dots and dashes, then I
do see the problem, as they have only transcribed it, and they have
not extracted any meaning from it. The intent of the exam is clearly
that you be able to extract a reasonable amount of meaning from the
CW.

> I fail to see how this is a NON answer.

Because he didn't answer the question asked.

ie: q: What's the length of a wave in free space at 100 MHz
non_a: It's in the handbook
a: Three meters.

In my case, instead of an answer, I got a different non-answer, along
with an ad-homenim attack.
Is this what one should expect when asking questions of ARRL VEs?

CB is NOT a stepping stone to amateur radio.
The CB band use to belong to us hams until
the FCC took it away from us! Ever since then
the FCC has been doing stupid things to destroy
our wonderful hobby like VE giving exams,
no-code tech license, and the new license restructure.

Dave.

Ten-Tec makes a 14mhz to 50mhz transverter, model 1208

I use this transverter with a President hr2600 ,shifted up 2 mhz from 26 to
30mhz (modified) to 28 to 32mhz, to reduce harmonics.
I installed the ChipSwitch and can work all-mode (repeaters as well)
The Transverter also must be modified to from 36 to 22 mhz.

The output of the transverter is nominally 8 to 10watts but can be adjusted
to produce more. Mine is set at 12 watts.

I had a problem with one of their dual band amplifiers which I use with an HT.

BUT, I can say that I sent it out to them, they fixed the problem, and the amp has worked fine ever since.

They appeared to be very intent on fixing it properly the first time, and the tech who was working on it called me to get first hand info on exactly how the amp was behaving.
I'd buy their products again.

The VX-1R does not have a power switch, but has to scan the keyboard continuously. This draws some current which empties the LiIon battery in about 2 months. I store my VX-1R in an optional leather protective pouch and just leave the battery lid open when the rig is not in use.

883. SWR/power meter - instructions sought

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-13 00:00:00 UTC
From: paul <prslootwegNOprSPAM@hotmail.com.invalid>
Message-ID: <1ae8bb60.b48545a1@usw-ex0110-076.remarq.com>
Source record: 77561

I have an old (cheap:) SWR/power meter.
It is marked;

AEG
SWR-50A

and has two dials - one for power and one for SWR.
A central control dial is for setting/calibrating the meter.

But... I am not sure how it is supposed to be used.

I was wondering if anyone out there had one similar -
perhaps you've got a copy of the user instructions?

Thanks,

Paul

Source record: 77565

FS: HF Killowatt solid state transmitter, amplifier and receiver. Receiver (R-1119) covers all HF up to 30mhz and is all mode, LCD digital readout, with SSB and CW filters. The transmitter exciter (S-1303) is matching in appearance with direct entry keypad (like rcvr) and puts out 1 watt into the matching KW output amplifier. The RF amplifier (T-1127) puts out about 1 KW. All items are nice in appearance and have no corrosiion. This equipment is commercial for the maritime shipping industry and complete with service/operator manuals. The manufacturer is Sailor Communications Corp. Those who know this company know its high quality and performance. Price is $985 for all. I also have a second exciter and amplifier available, same models. The only difference is that it is missing the final ceramic tubes (two 8122's) and an internal meter is missing. For the this exciter and amplifier I want $475. For those who want the entire package listed here, $1400 for all. Call Mike, (979) 693-1461 eves and weekends.

You're right! We need to substitute Latin for Morse. It too is a practically dead language, practiced only by hobbyists and religious sects, but Latin is far harder to learn than morse, ensuring not only empty spectrum but that everyone you meet is intelligent. We could have two classes, an entry level requiring only the ability to translate Ceasar's Gallic Wars, plus a "general" class for those who can speak and write Latin as proficiently as the Pope. Best of all, beginners would only be allowed to transmit Latin on UHF whilst those who'd demo'd papal proficiency would be allowed to QSO in English on any band! Sound like a plan?

Well stupid, if you didn't know, posting your straight e-mail address on the internet is not a good thing.
You might think its "Manly" and "the right thing to do" but you are subjecting yourself to spam programs
which explains why you keep getting junk mail and subscriptions to porn sites in your e-mail box.
Also, when you make a comment you are allowing people to respond by sending you e-mail.
Most people on the internet, don't deserve the toilet water they consume less deserve my e-mail address, less the right
to give their opinion in my sacred e-mail box.
Don't EVER knock people for not using their real e-mail address or using a handle. You have to as newsgroups are the EQ
of CB not HAM to begin with and you wouldn't give your personal info to CB'ers would you?

Date: 2000-06-13 00:00:00 UTC
From: ku4my@aol.com
Message-ID: <20000613135016.28335.00000417@ng-fl1.aol.com>
Source record: 77576

Does anybody know of a modification that will enable transmit above 30MhZ on the TS450S?

I am considering a transverter for 10 to 2 meters and the 'T' Kit, for example, will only give me an operating range of up to 145.999MhZ when the transceiver is set on 29.999MhZ.

I intend to use it for weak signal / SSB almost exclusively, but would like to be able to use it in the FM portions of the band too, if possible, as that would free up a FM mobile rig, used as a base, for other applications.

BTW, I have checked QRZ's mod data base without success.

Thanks and 73 de Tom / KU4MY

Why not? Everybody isn't out to 'get you', and for those few
who really think it's funny to 'subscribe' you to junk mail, etc,
there is a cure. It isn't the most simple thing in the world, but
it can be cured. And usually, 'that' person won't ever bother you
again. I say 'usually' because some people really are that stupid.

A fried called me with a problem with a MAHA charger. It was new. I called MAHA and explained the problem. They listened and agreed the unit was defective. They said to return it for repair and when I explained that the owner was handicapped, they sent him a replacement and said he did not have to return the bad one.

This made a believer out of me!

The receiver section, and any computing device embedded into the radio.
These fall under Part 15 unintentional radiator limits, and in the case of a
receiver capable of scanning, under Part 2 as pertains to the ECPA-94
requirement that cellular frequencies be blocked. This is a Type Certification,
not a Type Acceptance.

Type Acceptance is always specific to the particular radio service for which a radio or other device is accepted. The particular requirements are spelled out in the appropriate section of the rules, ie in Part 97 for amateur radio. There are no Type Acceptance requirements in Part 97 for amateur radio equipment other than for HF external power amplifiers. If you read 97.315 and 97.317, you'll see what a Type Acceptance requirement looks like.

Yes to RS. For all my Yaesus I use RS#272-1092 bulbs. On page 247 of their cat. The orig Yae bulbs are 10 volters but the 12 volters from RS are as bright and last longer. They are 2 for $1.49 and the Yae's are twice or more than that. Just remember to save the little sleeve off of the old one you take out.

It's no wonder that you get hate mail when you start off calling people "stupid." Only cowards or people conducting themselves in a questionable manner have to hide their identity.

A reason ham radio is declining is learning the code, and putting together a station is hard work compared to the ease of buying a computer and joining an internet chat room.

In some respects, the code is like learning a foreign language, and even though there are only a few dozen characters, somepeopleseemtosendcomletesentenceswithoutspacessoifyoumissaletteritmightbehardtofigureoutwheretopickitupagain.
O th er p e op leputp aus es in th e wro ngpl aces,m akingi t toughert o figu reo ut lettersyo umis s e d.

Some people are just better than others at learning languages.

While a no code license exists, it's more limited, and holders of that class of license seem to be looked at as second class citizens by some hams.

I don't think the theory is as much of a deterrent because people who are interested in ham radio are often interested in experimenting. They see a use for it.

Perhaps a compromise could be worked out so people who didn't want to learn the code would need to show greater understanding of theory for a given class of license.

But until the folks who earned their licenses the hard way decide the code is less important than getting more people involved in the hobby, little will change.

It doesn't matter how far you can send a message with 1 watt if nobody is listening.

They recently did away with that also for the external amps. They are
also "certified" also now. Required for any amp that operates below 144
mhz, made by a non amateur. MK

> and amplification level.....

In order to use any commercial 160m-15m HF amp on 10m, you have to "homebrew" the 10m section to enable it to operate. If you had to buy parts for this, I imagine the company would want to see proof of a ticket. There are NO external amps legally sold for use from 24 to 35 mhz.
Period. There are NO amps sold for use below 144 mhz that are not "certified" in the fcc database. Except for 1 a year that a ham can make and sell if he wants. A non ham can not build and sell an amp that operate below 144 mhz without certification. Period. There is no "type acceptance" for external power amps anymore. They must have a "grant of certification" in the fcc database. MK

FS: ITT MacKay model EB-3026 HF solid-state receiver. Has all mode operation with filters. This receiver is the same receiver as the MacKay 3020A with some minor upgrades. It works very well and is definitely a high performance receiver with built-in preselector making the VLF portion perform quite well as well. This one is very clean with a nice front panel. Price is $450 with manual. Mike, (979) 693-1461 eves and weekends.

After looking at information and reading all the reviews, it appears the Yaesu FT-1000MP Mark V has a receiver. I'm sure the IC-756 PRO will add a receiver when they come out with the Mark II series.

Some (few) older ships mainly from the former Soviet union still use
CW. Stockholm Radio are still working CW with some of them.

Stockholm Radio (SDJ) are listening for CW traffic on 500 kHz until at
least 2001-02-01, but regular transmissions stopped last october.

In scientology, they train their PR people to do this. It's called
the "non-answer" drill.

Ken, he asked wether it was legal or not, not wether you had asked
the FCC about it.

The USB one is 526-9193-00

My list shows USB (Z-4) in 4 kHz steps from 60 to 104 kHz, and LSB in two series from 64 to 108 but one set (Z-7) is 2.9kHz wide and the other (Z-8A) 2.4 kHz.
All are the same size (case L).
However, each set uses a differing dB reference level so a true comparison is difficult unless you can get hold of the complete spec sheet - I just have the General Catalog with basic specs for the complete line.

Can you check how much radiation there is at the second harmonic?
294 is right in the middle of the military aviation band and the FCC
might take that much more seriously.

The ARRL VEC has allowed that his teams may determine to accept dot/dash
copy.
Since he is so advising and certifying the team it de-facto endorses the
decision.
The question is moot with regard to legality.
To suggest otherwise is to (again) open the can of worms about forcing VEs
to accept substandard
performance. As a VE I certify my willingness to maintain the integrity
of the tests and this applies to
the spirit of the test as well as the letter. We do our duties as best as
we can within their experience
and understanding. It is the (FCC) which make final determinations of
legality and by refering our
questions to them, we get the best understanding of the interpretations of
the rules.
I fail to see how this is a NON answer.

I owned one about 10 years ago when they first came out. They are a very very good receiver.
One of the problems I noticed as did many others is that the small push buttons would stick !
Especially the A vfo and B vfo buttons when working split and checking the other freq. The sticking buttons were the only complaint I had and the only one I heard about on the air.

Hey! The 520 was my first rig, and I loved it! Not sure why your daughters hate it, but I made 800+ QSOs with that rig, including some pretty good DX, using just a dipole on the roof.

> Yeasu site.

Yes, the VX-1R has a high / low power setting. The exact RF output power is dependant on the type of battery being used. When you store a memory channel, the current power setting is remembered along with the frequency, repeater offset, etc.

High Power:
1 watt with external 6v DC source.
500mw with supplied Li battery,
100mw with AA battery.

Lower Power:
200mw with external 6v DC source.
50mw with either supplied Li or AA battery.

Now, you've opened yourself up to a whole new set of flamers. There are 2 things you really want to avoid talking about on these groups if possible: CB and code. You just have to realize that you will never be good enough, as good as, or good enough for some people. I was a part of the CB crowd for a few years before getting my No-Code Tech license. Either of those bits of info are enough for some people to totally black-list you. The fact that I am now in the process of upgrading to a (post-restructuring) General and plan to become a (post-restructuring) Extra makes no difference to some people. Never mind that a lot of the new General class hams were already working on 13 wpm. All they measure now if 5 wpm and that just isn't good enough for some. So the best thing to do is follow a bit of advice an old friend gave me that applies to this type of situation: Consider the source, and go on.

Best of luck. Get the license. See you on the air.

John

Hello!

Sorry for the beginnners question,

I just bought a 6m/2m/70cm Cushcraft Yagi antenna, and as I was putting it together, I read that the lead for the 2m and 70cm has to be connected to both, in order remain balanced. This would lead me to assume that the 6m lead comes in on a separate cable? I was looking at buying an IC 746 transceiver, which doesn't have 70cm. Does the VHF output on the IC 746 include both the 6m and 2m on one line, or are the 2 bands separated? If it does output both on one line, how do I resolve

that at the antenna.

Thanks!

Andrew

I won't settle for anything less than the NCEE Electrical Engineer P.E.
exam for the Extra, with at least 30 wpm of code. (More is better isn't
it?) And, unlike professional engineer state licensing, LET'S MAKE EM
RETAKE EVERY 10 YEARS TO KEEP THEIR LICENSE. And, oh yeah, the State
P.E. passing grade is a paltry 75%, curved. Let's make sure we only get
the best of the best, and set passing at 100%.

In only a decade, the ham population of the U.S. should be maybe 2, or
3. Now, if they just had someone to talk to. I'm sure there's a few
JY1 types out there who didn't test at all, but just declared themselves

a ham.

It sounds tough, but one must prove their excellence to access a public airwave, shouldn't they? Just like broadcasters? :)

>with something available locally, Radio Shack or?

Yep, the RS 3V watch battery and matching holder will work. Glue the holder in. Cut out the old battery by cutting close to the terminals. That gives you something to solder to. Solder the new battery holder to these leads, install the battery, and your done. Be sure to cycle the unit on and off after the battery replacement or the new battery will die quickly, according to a Kenwood bulletin.

Absolutely! There's always a few that don't ever want to see any
change, things should be just like they were 50 years ago.... (I call
them the "arthritis net") However, you will also find people that are
technically capable, motivated, and into all sorts of fun things.
(Try foxhunting, my personal favorite, or Skywarn)

I'm president of a ham club with a few of the inductive type
(resistant to change) but I've decided that they can groan all they
want, I'm not going to hold the club back on their account.

Come on in, the water's mostly fine :)

Not me,
Your opinion is worth as much as the name you sign to it. I'm willing to sign my name to what I say, and stand up like a man for what I say. If you were signing your name you might not make rude, lewd, obnoxious, derogatory, specious comments. If I get spam, I report it to the IP, same with porn. And my email address, while valid, is not my working address. I'm not stupid, I have a free Juno email address for newsgroup posts. My postings are items I wouldn't have any problem saying on a radio to another Ham. I wonder, which is more representative of you, the way you talk on your ham rig, or the way you write on the Internet. I try to use manners both places, it's the way I was brought up.
BTW, I've read a lot more trash on the ham newsgroups that I ever heard on CB radio, and I've had one of those since 1970. This looks more like 14.313 than 27.185. And yes, I've given my personal info to Cbers, made some good friends that way.

Mark K5MAR (ex KDW-1411)
And proud of both.

"Not me" <@.> wrote in message

Well stupid, if you didn't know, posting your straight e-mail address on the internet is not a good thing.
You might think its "Manly" and "the right thing to do" but you are subjecting yourself to spam programs
which explains why you keep getting junk mail and subscriptions to porn sites in your e-mail box.
Also, when you make a comment you are allowing people to respond by sending you e-mail.
Most people on the internet, don't deserve the toilet water they consume less deserve my e-mail address, less the right
to give their opinion in my sacred e-mail box.
Don't EVER knock people for not using their real e-mail address or using a handle. You have to as newsgroups are the EQ
of CB not HAM to begin with and you wouldn't give your personal info to CB'ers would you?

Message-ID: <FYE15.859$J34.3556@newsfeed.slurp.net>
Source record: 77451

Paul,
Can't compare the two, as I've never had the Kenwood, (although if it's as easy to use as my TS-440 S/AT HF rig, it ought to be pretty good), but I have the AT-600 and really like it. I bought my first one used, no manual, and was able to figure out 95% with no problem. Unfortunately, that one had been abused by a previous owner, so while it is off being fixed, I bought another one. Manual in hand, I was able to figure out the few, obscure options I couldn't get on my own. If you get the 600, get the "gift" package. It costs a $100, but you get a NiMh battery, a low-power NiCad battery, DC power cord, and a drop-in fast charger. Well worth the money. And the PC programming cable and software is nice, too. (But extra)

Mark K5MAR

PS: For those of you that are going "Ha! A tech admitting he used a HF rig! Report him to the FCC!!", I didn't saying anything about TRANSMITTING.

Source record: 77453

Scott,
Boy, it's really hard to say anything that all these others haven't already said, but what the heck, here goes:
GO FOR IT!!!
There are a lot of nice guys and gals out there in radioland. Most everybody you talk to will be as nice to you as you are to them. (Gee, I could make a "rule" about that, think I've struck gold!) You'd be foolish not to take advantage of the no-code tech license to get on the air while you're studying for your upgrade.
The is a thing in Ham Radio called "The Elmer". This is a more experienced operator who is willing to pass his knowledge along to a newcomer. Check the ARRL website for your nearest club and attend a meeting. I'm willing to bet there is someone there who is willing to assist you and show you the REAL meaning of Ham radio - FRIENDSHIP!
With the assistance of several members of my local ham club, I'm on my way to General and beyond. And this has nothing to do with the current restructuring, as I took my first Tech test last year BEFORE the revamped rules were announced. (Passed the 3A, missed the 3B by one. But then I took it "cold", no advance studying.)
Study, Learn, Test, Upgrade It's as simple as that.

Welcome to the wonderful world of Amateur Radio!
Mark K5MAR

They can take all the time they need. But they didn't pass a 5 wpm test...

>Sounds like old farts that don't want new blood in the hobby, again.

First we allow people to pass the written (by memorization) who don't know the tested material, and now we allow people to pass the code test who can't do code at the required speed. How much easier can we make it for the new blood...

Yes, and further we may choose to apply a multiple guess test OR a fill in
the blank test.

>
> This creates a division in testing standards, and invites confusion
> and debate.

No, the standards are the same, the application of the test varies.
Consider a driving test, does the testing officer HAVE to test each
candidate the exact
way all the other officers do? The test is an honest effort at evaluating
the quaifications
of the candidate. There is NO confusion if you have inquired as to the
requirements the
team will demand. Further, debate is not a bad thing, I see it as a
healthy exchange of
ideas to improve the hobby.

> You can hardly make a move like that, and then snap at
> people who question the percieved disparity that results.

If I am guilty of "Snaping at people" I apologize.

Well, I certainly qualify as an old fart, and I want new people in the hobby. But if it is required that you pass a 5 wpm test, and you take time *after* the tape has ended to go back and decipher scribbled dots and dashes, you're not receiving at 5 wpm. It's more like 4, 3, or 2 wpm, depending on much extra time you take.

Go for it Scott!! You will meet all kinds. Just remember, HAM radio is nothing special. Just like any other group, it contains a cross section of all elements of society. While there may be a slightly different mix than some other organizations, you will still see the extremes of personalities.

Don't let yourself be discouraged. Pick YOUR path to get into HAM radio, and don't let the external influences try to choose it for you.

Code? Yep, it's neat, it's fun. But it's just ONE aspect of this hobby. And yes, it is required for HF operations. For now. But remember, 5wpm is not that tough. It's just barely over what most people can do with just 'memorization' of the characters. Faster code? If you want, but remember, it's if YOU want to. Don't let anybody tell you a faster wrist makes for a better operater. It just makes for a faster CW operator. BIG difference.

And remember, getting your license is an ENTRY exam, not a 'final' exam. Where you take it from there is up to you!

> There are NO external amps legally sold for use from 24 to 35 mhz.

While that is certainly true, 1000s of amplifiers, some of high quality, were legally built before that rule went into effect and they, plus some that were illegally built later but purposely not dated, are readily available on the used market.

The (original?) question remains: "Can a duly licensed amateur use one of these amplifiers on a band (eg, 10m) he is licensed to use provided of course that his emissions meet other requirements?".

It would seem that, as a practical matter, he could; given that the same amateur can legally home-brew an amp or buy a pre-ban or home-brew amp from another ham. How would FCC know (or care) if I built it myself or had owned it for 30 years, or had purchased a once illegal but non-working and hence legal (ie, no gain) amp for "parts" then replaced the finals, so long as I wasn't *using* it illegally?

I posted this question to FCCs Amateur Enforcement folks and will post their reply here as soon as I get one.

From: zirconx@my-deja.com
Message-ID: <8i8c7m$3l2$1@nnrp1.deja.com>
Source record: 77470

Hello. I have been thinking about buying a VX-1R for a while.
I would like to know if it has power levels or just puts out
1/2 watt all the time. It doesn't say on the Yeasu site.

I hope it has power levels, I always feel like I'm wasting
my battery power when I can't turn down the the minimum
required. I had a DJ-S11 for awhile, almost always used
it on the 50mw setting.

Thanks for any info,

Ryan

>The VX-1R does not have a power switch,

My schematic shows a push button mechanical switch labeled "PWR". The little red push button switch on the side of the unit says "PWR"...

>but has to scan the keyboard continuously.This draws some current

The VX-1R has no matrix type keyboard. All the push-button control switches are separately wired to the microprocessor. I can't tell from the schematic if only the power switch is scanned as I first suggested, but this would be logical programming since you don't need the other switches when the unit is off and scanning them would waste power. But then it may be illogical to assume Yaesu would be logical...

>I store my VX-1R in an optional leather protective pouch
>and just leave the battery lid open when the rig is not in use.

A good idea. However it would have been nice to have a real on-off switch as does my Icom IC2SAT which was the mini-handheld of it's day. I seldom listen to VHF and it's annoying to find the battery dead on the Yaesu. But then there are several things that are annoying on this Yaesu handheld...

I would have to agree with Mark about the AT-600. I was able to get the radio itself, pc programming software and cable, soft case, speaker mic, and the "gift" pack(includes great NiMh long lasting battery(5W), low power NiCd, car power adapter, and desktop rapid charger/conditioner) for $400! There is no way to get all that with any other radio that has the capabilities that the AT-600 does. The radio performs well and is easy to use. BTW, the desktop rapid charger/conditioner
that comes with the "gift" pack will charge and condition batteries from other manufacturers. It has 6 different cup adapters for many Standard and Icom batteries. All in all I have been happy with the AT-600. It is a great buy and performs well.

Sure, it can be used by a ham. A ham can use ANYTHING as long as it's
clean, and within the legal power output. It doesn't matter who made it
, or where it came from. If a ham can ensure or modify it to be within
the legal specs as defined by the fcc, it is LEGAL to use. Now for Joe
Nonham to try to sell these amps on the street, thats another story.
It's like the case of my henry amp. It was sold as a 80-15 meter amp,
but I have modified it to work ten meters. It is legal for ME to use.
And I could sell it that way if I wanted to another ham or dealer. But
according to the way I interpret pt.97 I could NOT sell it to a non
amateur. MK

Scott,

As has been pointed out to me many times, this is a news group, NOT
ham radio! As a no-code, and now a slow-code, I have NEVER been
'slammed' on the air. The rabid anti-no-coders are less than 1% on the
ham community, but they are very vocal here.

Please go to a local club meeting / ham store / swap meet and meet
some REAL hams before you make any judgements about hams!

73, and good luck!

Ken

**** YES! This software is now updated to reflect the April 15th
**** changes in FCC licencing structure for Amateur Radio. The software
**** contains questions for the new and old ham tests as well as
**** the unchanged professional tests.

Greetings!

dauntless-soft.com is pleased to offer high quality MS-Windows test
preparation software for the FCC/HAM plus some Professional tests
available for shareware download at http://www.dauntless-soft.com.
(aka http://www.hamexam.com -- easy to remember address--tell your
mates!) The program will drill you for the following elements:

ELEMENT
2 (NEW) Technician
3 (NEW) General
4 (NEW) Extra
2 (pre April 14, 2000) Novice
3A (pre April 14, 2000) Technician
3B (pre April 14, 2000) General
4A (pre April 14, 2000) Advanced
4B (pre April 14, 2000) Extra
1 GROL Basic Radio Law
3 GROL General Radiotelephone
7 Radar Endorsement - Ship Radar Techniques
8 GMDSS Radio Operating Practices
9 GMDSS Radio Maintenance

You are welcome to download this and give it a try. Secure online
registration is available--a $30 registration unlocks ALL the questions
and entitles you to FREE LIFETIME UNLIMITED UPGRADES of the
software. That's less than $3/test.

This software is based around the same engine that drives our FAA test
prep software that has helped many pilots score very highly on those
exams. (Yes, we got a new hobby and decided it was time to write
software for it, too!)

Thanks for your time. We look forward to your visit!

You are absolutely correct or at least that is what most of the hams on usenet indirectly believe. They think the ARRL proposal and the FCC ruling were good for amateur radio. (Dumb down the standards! A service full of retard hams is better than a service full of smart ones.)

If anyone disagrees, then you should be able to support the following:

Step 1: No more automatic renewals. Individuals must retest and pass all elements required for their license class.

Step 2: The passing score for written exams should be 90%.

Step 3: Two code elements, 13 wpm for General and 20 wpm for extra.

Step 4: No-code license should be one year non-renewable.

There's a grain of a good idea in there. Retest every ham
every ten years and increase the passing grade requirement
one percentage point for every year he has been a ham until
he is required to score 100% after being a ham for 30 years.

The moral of the amateur radio "licensed" operators is at it's lowest in three decades.

If your looking for the FCC to eliminate amateur radio licensing forget it. The hams across this great nation and world will not allow it to happen. Why don't just sit back, study the thoery, code and take the test like the rest of us.

I think the correct way to state that is:

"A service full of hams or no new hams at all"

I would like to thank all of the people that replied to the postings of my concerns.

I have been a CB'er for about 15 years and I have decided to upgrade to a more controled and friendly atmosphere. CB is great for travel info and everything, but it only takes one inbreeder in a 7-10 mile radious to turn a conversation into a "I'm a bad-ass" contest.

Thank for the encoragement and I hope to DX with you all in th enear future!

Scott

Let's get real here. I got my ticket primarily for the public-service aspect of ham radio. I'm not interested in cw nor am I interested in contesting. The concept of spending umpteen thousands of dollars and countless hours just to get a signal report from someone in Zimbabwe is ridiculous as far as I'm concerned. I am *NOT* knocking those persuits for those who do like them; it's just not for me.

That said, I hold a no-code tech license. If it were necessary for me to learn 5wpm cw to get _any_ ham ticket, I would not have bothered, and instead I would probably have looked at REACT. I'm sure some of the old farts reading this are probably thinking that would be better, however let's remember that first and foremost, public service is what ham radio is about and it's why the FCC doesn't just go and grab all the bands for commercial purposes.

Ham radio has to keep up with the times. During it's heyday, if one wanted to be involved with electronics and communicate over vast distances, ham radio was the only way to go. Contacting someone in Zimbabwe was considered a "big deal" then. Now, with cheap long distance and the Internet, the public is no longer impressed, and may, in fact, think that anyone who would go to such trouble instead of just picking up a phone is foolish.

If you insist on making the entrance and renewal requirements of ham radio more difficult, there will soon be no new hams. All you have to do is look at the average age of the ham radio population to see that is exactly what's happening. It may already be too late to change that.

You probably will have to switch crystals in the transverter to cover the top two MHz, and then only if the other tuned circuits in it are broad enough to work above 146.

First let me start off by stating that I am a lowly Technician class radio amateur. I have been licensed for nearly two years and I have enjoyed the bands that I have access to. When I was beginning to become interested in ham radio , I wanted to "work the world" and do some dx. The fcc amateur restructuring has made zero difference in my particular situation. I still need to master 5 wpm to gain access to the hf bands and I still intend to do so. Do I have a problem with increasing difficulty to get more privileges? Yes and No...I do feel that you shouldn't get "something for nothing" and just get a license. However, why is morse code the "chosen mode" for gaining a higher license? There are many modes to operate in amateur radio and simply being proficient at sending and receiving code, doesn't make you a good ham operator. 5 wpm is adequate in my opinion because if you are interested in operating cw and/or qrp , you will get more proficient with cw due to experience. The "die hard" hams out there are so concerned with degradation of the bands...What do they care? All of the of the hams that don't use code, won't be hurting or bothering their precious code allocated portions of the band. The other question that I have...How many of these "die hard" hams are actively involved in their local ham club and community? I can tell you that the club I belong to has about 70 members and most of which are advanced or extra class operators. At the last meeting, I brought up an upcoming event in the community that needs about 6 folks from our group for communications for the event. The same lowly-classed hams like myself were the only ones that were willing to help. All I needed were six out of the 70...SAD!!!!!! The other sad fact is its always the same 3 or 4 active guys in the club that do 90% of the work. I think this is typical of most clubs everywhere and this is where the REAL problem is in ham radio. I guess the higher-classed guys that are code proficient are too busy working cw to help the community, the club, or a new ham...

That is pretty good Old Biker. But it doesn't go far enough, as Latin
actually has some utility. I suggest we go with Celtic, as it is MORE
like "Morris" code in that it has absolutely NO utility in today's
world. Those that passed the Extra examination would be given the
privilege to converse in Gaelic on the HF bands. Novices would be
given the "opportunity" to converse in Assyrian ONLY on 28.100Mhz,
until they built up their dead language skills - those filthy, whining
novices!

Yes, it takes a lot of work for them to drag their feet for so long.

BTW, not all of them are so pig-headed. But many of them are - and it is only thru attrition of their numbers, due to advancing age, that change has finally been possible. Up until restructuring, the number of licensed General class hams had been declining at an ever more rapid rate over the last 3 years. But there are STILL a lot of bitter, old coots out there. However, on this newsgroup, the more vocal "Morris" code pundants are mostly only about 45-55 years old, and we should have them to "kick around" for a long time to come!

Good luck with your Amateur activities.

1015. Re: Thinking of becoming a Amateur Radio operator....

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-14 00:00:00 UTC
From: Tim Thompson <tthomps@nospam.erols.com>
Message-ID: <8i70bmbuh1@bob.news.rcn.net>
Source record: 77545

Scott,

Before I got my license last fall, I had the same reservations that you do. From reading some of the comments in the newsgroups, I'd gotten the feeling that a no-code technician was going to be reviled upon their first transmission.

However, I was pleasantly surprised. I took a Novice/Tech/TechPlus license class at a local club and found a nice group of people to welcome and help me. By this past March, I'd upgraded to General and had joined the Goddard Space Flight Center Club (I note that your e-mail address is from KSC). I haven't met anyone (personally or on the air) with a negative/obnoxious attitude.

Go for it! You'll find a lot of interesting people.

73,
Tim

1017. Re: CODE

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-15 00:00:00 UTC
From: Don <kd6hq@sonic.net>
Message-ID: <BT725.77$ly.14936@typhoon.sonic.net>
Source record: 77347

Right I agree with doing away with the code and while we are at it lets do away with all requirements
for college degrees also, so that every one would have a chance at those hi-paying tech. jobs not just the ones
who have worked for it and earned it, I mean really why do I have to know a foreign language if all I am just going
to do is design circuits. Oh yes I have a friend who needs a better job. So I will be hiring him to repair you radios and your car all at
once..... Please send me your business.....

The fact of the matter is that CW will die of it's own natural death much the way rock wheels and wooden axles have.
There are those who enjoy cw as there are those who enjoy computers. I happen to enjoy both. As for doing away with the requirement for code, right now it is an international agreement and in time this will change also. I for one am
unwilling to let it die easily for it is one of my accomplishments that I really enjoy. If you look at the number of people in the world and then look at the number of people who know and use cw I believe you will find it quite a high ratio.
Being part of that small group makes me feel good. There are lots of arguments both for and against cw, like it uses
less spectrum than any other mode of operation but at the same time it is slow compared to other modes. The
argument of pros and cons could go on for a long time. But what's the point? I would think that it would make more
sense just to enjoy what you have and just accept that sometimes you have to do things that you do not want to.
The best part is that once you've done it you never have to do it again, sort of like taking a foreign language class.

Drew:

Sounds like it's associated with the "optical encoder" disk associated with the tuning knob. The optical emitter/detector pair might have gotten dust or smoke after 15 years or so and need to be cleaned. Could be something else in this signal path too.

The repair cost is only a part of the picture. Shipping cost and shipping damage can be a bigger problem. Unfortunately, I've had UPS damage both a 930 and 940 when I shipped them (packed well). At 50+ lbs each, they seem to drop them often. Best bet is if you can find a local ham to help you out. I take on some of these cases for the guys in Northern NJ.

> Kevin KB5HFM

If it is a continuous buzz then check the fuel pump. If it is like my 98 F-150, the pitch goes up and down with the RPM's. If that is the case then it is being radiated out from under the hood. Take your antenna off and see if the noise goes away. If it doesn't then check your power lead. And if you find a cure then let me know because i'm still trying to get rid of the noise. New plug wires, plugs, ground straps, grounding exhaust pipe to frame and on and on. People next to me can pick it up in there radios it's that bad. By the way, it is the V6 engine.

Good luck

1020. Linear amp for aviation handheld

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-15 00:00:00 UTC
From: n470xx@my-deja.com
Message-ID: <8ib4sg$5u2$1@nnrp1.deja.com>
Source record: 77350

I am interested in a linear amplifier for use with an aviation handheld transceiver used in the 118-136 Mhz band. How would a 2 meter on work over this frequency range? Would the mismatch be too great and would I be able to tune it acceptably to my J-pole antenna cut for the center of the 118-136 Mhz band? I am looking to boost the output of the nominal 3 watt output.

It is better to use a DUPLEXERS or TRIPLEXERS. The 6 mts goes to antenna 2 and
2 mts goes to antenna 3. Put HF on antenna 1. If you have a TRIPLEXER you can
put 430- 450 other radio.

Both ham radio and CB suffer from this phenomenon, but not to the
degree you imply.

Our club provides assistance to the Red Cross, various athletic
events, and on a continuing basis through the county emergency
operations center and Skywarn.

Most people don't get into ham radio as a way to do public service.
It's usually the other way around. You get a licence, and then
discover the opportunities to serve that utilize your abilities as a
ham, beyond what a non-ham can provide. In my case, I feel that
since the public is loaning us these bands to operate on, we should
perform some public service in return. We certainly see enough
instances where normal communications channels aren't suficient in an
emergency..

During the Y2k rollover, we were on standby to provide communications
in case the county's 800 system went down.
Motorola couldn't provide any assurances that it would remain
operational, but our radios simply don't care about the date. As it
happened, nothing happened. I didn't expect anything to happen
either, but we were there.

Last week I had a downburst near where I was storm spotting. It took
out the phone lines, and the cell system lost eight towers from the
same storm. The area happens to be on the fringe of the county's 800
MHz system, so the only thing that was working, in terms of getting
help and reporting what was going on, was our 2 meter repeater.

A month ago, we had a severe hailstorm, and our advance warnings
probably saved lives. With several square miles covered with

baseball sized hail, we had no injuries, and only unavoidable property damage.

Yes, my car flies Skywarn signage, and flashing lights. At the request of the county EOC director.

I also carry an ID that extends his authority through me, so I can get past police roadblocks in an emergency, and be on the street during snow emergencies. We routinely carry patients to the hospital for dialysis and deliver urgently needed prescriptions during heavy snowstorms. This could be done by ambulances, but we free them up to make more serious runs, that we can't handle.

We are very aware of the "cop wannabee" problem, and if we ever see it happening, we will step on it fast.

As for literate, I'll let my movers answer that one. I had enough books in my last move to double the packing time from their original estimate.

> If they were **really** interested in "Public service", how about
> volunteering at the library, local hospital, animal shelter or soup
> kitchen? Oh, no one to "boss around" there. Couldn't "look cool"
> with that 8 pound brick on your belt. Sorry, should have known.

Not interested in "bossing anyone around", and I don't "look cool" with or without a radio.

When I lived in rural california, within a month of moving into town, I had signed up for the fire department. This is an unpaid, totally uncompensated position, that requires many hours of training, and many many interruptions at any hour of the day or night. Most of our calls were called out to freeway accidents, so it wasn't even helping anyone we knew, or were ever likely to see again. I did take a certain amount of pride in being a fireman, who wouldn't? The interesting thing is, I was just as happy to be in doing equipment checks or cleaning hoses as pulling people out of wrecked cars, or putting out fires. It also taught me a lot about myself, like that I make a better follower than a leader. Funny thing is, when I realized that, I expected to be disappointed somehow, but I wasn't. I'm prefectly happy not to be in charge.

When I first got my licence, I lived in Anaheim Ca, and belonged to a group of hams who were also amateur seismologists. (comes with the territory, literally) Don't laugh, when a quake occurred, the news media and city officials went to us first to find out what was happening, then to Cal tech for the official (but somewhat delayed) story. The watershed event for this was in the simi valley quake, we had the center of damage pegged properly, but epicenter determinations from caltech sent all the emergency equipment into an area where there was very little damage. This is where the city governments learned the difference between the epicenter and the hypocenter, and that seismometers can't find the hypocenter in any

useful sense. With our many observers all over the area, we could pin the damage center very quickly, usually in just a couple of minutes. It was very similar in effect to Skywarn here in the midwest. The NWS radars are fine, but they don't cover as well as you think, they have a six minute delay, and they can't tell you what's happening nearly as well as a trained observer at the site.

Am I a typical ham? I don't know. I guess I'd like to think so.

What public service have you done lately?

John,
Thanks for the warning.
I am looking forward to getting my license soon, but I don't see me being on the air for a while due to Radio costs and my other responsibilities.
I do look forward to becoming a HAM, if for no other reason so I will be able to keep my scanners!

I will always keep a CB in my car, it beats the hell out of a radar detector and a map most of the time!

I look forward to someday being on the air with a range better than 10 miles, but I won't forget where I came from!

> my first try at finding parts...

Congrats on the new ticket. You'll have a lot of fun with ham radio
and it could turn into a lifetime hobby.

You can buy crystals at International Crystal. Just give them the
name/model of your radio and the frequencies you need and they'll
do the rest. Their particulars are:

http://www.icmfg.com/
1-800-725-1426

I suggest before you tie up a lot of money up in a multichannel
crystal radio that you check the various swap groups like
rec.radio.swap and locate a synthesized handheld like the HTX-202
and never buy another crystal again...and yes, normally two meter
channels above 147 MHz transmit 600 KHz higher than receive, but
check to be sure of your particular repeater.

Well, it would be a violation of service... But what you can do and get
away with is not the same thing as do legally.

So, if you were in an emergency situation for example and you HAD
to do this.... Just make sure the amp is in fact a linear, and not
class C. Most 2M amps would be FM only. And you would probably
need to retune it drastically. AND avoid amps with 'pre-amps', as
a lot of them might be difficult to tune down below 130.

If you enter as a "no code" technician, you are basically limited to "phone" or voice on the 2-meter and .70-meter bands. Your license will allow you other bands (from 6-meters through the GHz'es), but most of the activity is really on 2-meter and 440 mHz, at least that's where I find most of the repeaters and local clubs. The range is somewhere in the 5-25 mile area, depending on conditions, transmit/receive power and range of the repeaters.

What this means, locally, is your amateur experience will be more influenced by the attitude and interest of other hams in your area than by any hams in distant locations or around the world.

If you enter as a 5wpm code technician, you will have both code (CW) and phone privileges on all those VHF/UHF bands, but you will also have some privileges on some of the HF bands (10m - 160m), but not all of them and not at all MHz frequencies. However, this does increase your audience greatly.

You should be able to scan 145.11 through 147.39 (repeaters) or the whole 2-meter band (144.000-148.000 MHz) and/or 420.000-450.000 MHz (.70m), 222-225 (1.25m), 50.000-54.000 MHz (6m), 28.000-29.700 (10m) to get an idea of what's going on in your area. Listen for callsigns, look them up at www.qrz.com or www.arrl.com to see if they can be contacted by telephone. Find out what kinds of activities they do. Find out if there's a local club. See if there's going to be "Field Day" activities in your area this month.

That should give you a good hint on how welcome you'll be, but remember, there may be a lot of hams in your area that aren't on the air all the time. These are the guys/girls that sometimes make it welcoming.

But ... welcome!

With an address of "HotPrsut" one would assume that you're referring to yourself. However, since you chose to address your sweeping generalization to my posting, I'll reply to it.

It just so happens that the fire chief of the community for which I provide communications assistance, was involved in hurricane Andrew. He saw the value of having ham radio assistance during emergencies and has had the participation of amateur radio volunteers written into the village's disaster plan. The local police and fire dept. personnel welcome our assistance and we have access to their frequencies as well as certain facilities that are not open to the public.

There are 8 of us in the group, and none fit your generalization. Many are professionals, and some, like myself, own our own companies.

In the future, you may want to refrain from describing yourself when you really mean to slam someone else.

I though I saw somewhere that one minute of perfect "corrected" copy would qualify. It did not say one minute of perfect "original" copy. Seems to me this wording would allow correction of klingon heiroglyphics if the testee so desired.

Yes, I fully intend to have a modern mobile, and modern HT, once I get
the money saved up :-)

I'm starting here because:

1) it only cost me $15 so far, and I bet I can get on the local
repeater for under $50. It may not be pretty, but it's a start.
Besides,

2) I know a bit about practical electronics, and want to get more
practice. this looks like a good way.

Thanks for the web site, I'll be getting the crystals once I overhaul
a microphone (to use a 1/4 inch plug) and test the transmit section.
I already know it receives...

Scott,
Watch for the Radio Shack HTX-202, these can be had quite cheaply, $75-$80.
This is a solid 2meter only handheld. It's cheap enough for almost any
budget, and will get you on the local repeaters. It has all the bells and
whistles you could reasonably want (or need) for 2meter operations.

1048. Re: Linear amp for aviation handheld

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-15 00:00:00 UTC
From: Jim Weir <jim@rst-engr.com>
Message-ID: <u6riks0q9mv9g2h58g0d15g09vfnfmeauu@4ax.com>
Source record: 77378

n470xx@my-deja.com
shared these priceless pearls of wisdom:

->I am interested in a linear amplifier for use with an aviation
->handheld transceiver used in the 118-136 Mhz band.

The usual caveat -- what you want to do is illegal as hell.

Now that we've got that minor point out of the way, be sure that the "linear" 2-m amplifier has the little switch on the side that says "CW - SSB" or that it is in fact rated for single sideband (i.e. AM) use and that it is in fact linear.

Then get yourself a sweep generator (no, there is no other way to do it) and adjust all those variable capacitors and inductors for a flat 118-137 MHz. bandwidth. You are going to lose a hell of a lot of power by broadbanding the sucker, but you really don't want more than 10 watts output anyway. More than that and you start getting RFI in the cockpit problems that aren't easy to deal with.

The sweeper won't put out more than a milliwatt or ten, but if the amplifier is linear, it shouldn't make a difference. If you have the opportunity to modulate the sweeper with a sine wave, adjust for both flatness and maximum % of AM modulation at the same time. It is like rubbing your head and patting your belly at the same time, but once you get the hang of it, it isn't all that difficult. Then check using your handheld at band edges and band center for power and modulation percentage.

Now I've never done it *myself* mind you, but I've got this friend Ernie...{;-)

You'd probably get more and better answers in rec.aviation.homebuilt than here. Most of the twiddle jocks over there do this sort of stuff for fun.

1049. Info req - HF mobil whip for SGC 230 coupler

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-15 00:00:00 UTC
From: tguter <tguter@ucsd.edu>
Message-ID: <8ibvu0$f13$1@news1.ucsd.edu>
Source record: 77379
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I have an HF rig with SGC 230 random wire coupler which I'm planning to install in a motorhome with metal roof. The SGC requires a minimum of 8 ft of wire (12 awg), but 23 ft or more is much better.

For $350-500 I can purchase an SGC whip specifically designed for such an application, but my budget is not up to the task at this time.

Before I "invent the wheel", I'd like to hear from those who have traveled this road before me. I'll be using the rig with the motorhome stationary and plan to raise the antenna to its vertical operating position manually.

A 23 ft long unloaded spring base whip would be ideal, but I have yet to find a source.

HRO says to use a 102" CB whip, but the SGC 230 manual (written in 1997) specifically warns against this solution because of voltage considerations at high power (100 watts).

I'm thinking of a 3' section of 2" sch80 PVC as a hinged base with a 23 ' copper pipe flag pole stepped from 11/2" down to 1/2" over the 23". I haven't tried this yet, but seems like it would stand up in none windy conditions.

All ideas cheerfully accepted.

You'd have to look very closely to tell my ht from a cell phone. Same size, same color, same display and same keypad. Only external differences are ptt button, rubber duck antenna and volume knob. Don't see where anyone would think that a radio LOOKS more cool than a cell phone.

Nope, and there isn't anybody to "boss around" when I'm 18 miles southwest of town, trying to get a visual on a possible tornado reported by radar that needs to be confirmed, all while peering through blinding rain and hail that is beating down on my car. There's nobody to "boss around" while I'm slogging through knee-high floodwater trying to get the last nursing home residents evacuated before the river crests. There's nobody to "boss around" when I'm poking through debris in the rain and dark that used to be a busy little town of 10,000 before the F-5 tornado hit and leveled it, trying to find any survivors that may need help. Wasn't much interested in looking cool, either. My "8 pound brick" was there so I could get help, assistance or report conditions. Say this isn't likely? Every item mentioned occurred within 30 miles of my home in the last 14 months, and hams (like me) interested in "Public service" were there helping. Oh, BTW, I'm also a certified First Responder (at my own expense), and was a volunteer at the local Humane Society for 4 years, until changes in my work schedule prevented me from continuing.
Maybe Hams like me are interested in "Public service" because we care more about our communities than we do about getting W.A.S. or DXCC on CW.

Use a 102" whip and a Hustler fold-over bottom section to get 13.5'.
That will do you for 30m-10m. You really need a loading coil for
40m and 80m. However, three Hustler bottom sections plus a 102"
whip would get you to 23'. Watch out for overpasses. :-)

Hello,

If anyone has a Service manual for the 706MKII G, could you tell me if there is a Test Point to measure the SWR meter voltage. I want to add a external SWR meter and want to take advantage of the built in circuit.

thanks

Ken

I am sure you are looking for a surplus or used cable. But, there is a company that advertises in QST called R&L Electronics http://randl.com that have a KW2000 for $14.95. It is a little pricey, but it is the cable you are looking for.

cheers

That doesn't say much for your company, Mark. What if prospective
customers do an internet search on you and see:

>Good. Get it reeeal hot, and then, shove it in your eye.

I sure wouldn't care to do business with a company president who
makes such hate-filled remarks, and would make sure others I know
avoid whatever it is you and your company does, if at all possible.

That's fine if you don't mind being leashed. You're helplessly dependent upon untold billions of dollars of computer equipment belonging to thousands of corporation, interconnected by millions of miles of cable, staffed by thousands of workers putting in tens of thousands of man-hours per day to keep that incredibly complex system running.

Hams, on the other hand, have no such dependence. It's the *only* communications medium in which any two operators anywhere in the world can communicate without using government or commercial communication services. Those same two operators don't even need to purchase commercially-built radios -- they can build their equipment themselves.

BTW, the prediction that ham radio is dying is older than you are: In "...1922 many radio magazines which had catered to the transmitting amateur swung away from him, one even so far as to run an editorial ... prophesying the end of amateur radio." (From Fifty Years of ARRL.)

1070. TS-930 tuning irregularity

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-15 00:00:00 UTC
From: abrayten@aol.com
Message-ID: <20000615061349.23618.00002475@ng-ba1.aol.com>
Source record: 77430

When the tuning dial on my TS-930 is turned in either direction, the frequency read-out does not consistently change in a digit by digit linear progression. Rather, for example, when the dial is turned clockwise, the readout may go up (7.950, 7.951, 7.952, and then downward 7.951, 7.950, etc. before going upward, particularly when tuning slowly. Sometimes the last digit is skipped over too. Any ideas as to why this irregularity exists, and the potential damages $ to get it fixed if it gets any worse? THX, Drew KD4QCX

What would we have to do with it? We don't make the rules. They have
just chopped the code tests down to a level that would be nearly
unusable in the real world. They will probably do away with them
totally, soon after the next WARC I bet. What more do you want? Yep,
auction off spectrum to a commercial interest that probably won't use it
either. Sounds like a real winner.... MK

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

From: <k9ty@attglobal.net>
Message-ID: <3948e560_2@news1.prserv.net>
Source record: 77439

I have a Kenwood TS570SG and a Tentec 1210 2m xverter. I have done the mod on the 570 that removes r41 from the control board (MARS mod) to open the TX. This opened the TX on 10m (used with xverter) to 30.0MHz, but I want to know if anyone knows a mod to open TX to 32MHz. This will let me run the xverter from 144 to 148 (all of 2m).

Please reply direct. I don't get to the newsgroups very often.

Tnx

Interesting that so many of the newer Hams continue to tout the "Public service" aspect. My experience with this group is that they are generally fat, lazy, often semi-literate, "cop wannabes". Most have never been in any position of authority nor exercise any sort of control over their lives. This frustrates them. They see "Public service" as a chance to carry a radio on their belt and be "important".

While the professional officers always warn these folks to leave the policing to them, invariably, these cop-wannabes take matters into their own hands, ultimately botching the situation and giving Amateur Radio yet another "black eye".

If they were **really** interested in "Public service", how about volunteering at the library, local hospital, animal shelter or soup kitchen? Oh, no one to "boss around" there. Couldn't "look cool" with that 8 pound brick on your belt. Sorry, should have known.

Or, so it seems to me.

In article <3947E3E2.6569519F@FSI.NET>, "Mark says...

I have an ft-101ex I would like to sell or trade. The AM recieve is a little low, and the power on 10 meters and possibly some other bands is a little low but the ssb, and cw recieve is perfect, and I think a new driver, and maybe an alinement and the radio would be all set. I will considder trade with cash for a solid-state hf radio that might make a decent backup radio, or, if you make me an offer, more then likely if it isn't rediculas, I will considder it. I have with the radio, a sure 444 mic, very banged up, but works fine. Email me if interested at n1umj@mediaone.net

Source record: 77250

My experience has been that the Heil elements even with the inline preamp do not put out enough to overdrive a 775DSP. I finally went to an outboard pre-amp to take care of the problem. There is nothing wrong with the mic or the headset, it's just low output relative to the preamp and mic combo in the Icom desk mic.

Others have reported no problems using the same combination, so there may be different 775's out there or they may talk louder than I do.

Enjoy!

Bob

My 775 does not work good at all when just using the Heil Headset without a pre-amp. It does not work super great with both the Heil Headset with the Heil pre-amp. My SM20 works very well.

I also have a friend that has the same problem with low audio output when using the Heil Headset on his 756.

The strange thing is other people with 775 and 756 transceivers have no apparent problems when using the Heil Headset. I wonder why this happens?

I contacted ICOM and at least one service manager feels like this is not ICOMs problem even though my Heil Headset works great on both Kenwood and Yaesu HF transceivers. I would offer at least an explanation to my customers if I were ICOM as to why a certain brand microphone did not work on some ICOM transceivers while working fine on two major competitors radios. I would especially give an explanation to high end 775 owners since this radio was not shipped with a microphone of any kind. Instead, ICOM just ignores their customers. I will return the favor by buying Yaesu the next time around.

Good Luck,

Dave kg0us@swbell.net

Yep good advise. Add a second hand mobile Mag antenna for around 10 bucks
and you will do fine. A friend of mine bought a used HTX-202 at a
fleamarket in Hamburg NY for $10.00! But always remember buyer beware when
it comes to used equipment.

Jason,

Is the key still available, are we talking about the keyer paddle and
what can you tell me about it? The condition (appearance), how does it
"feel"? Some of the new ones I have tried, feel real stiff, which is not
the way I remember my old Vibroplex "Bug". Can you send me a photo?

What do you consider affordable? And are you trying to decide between the two, or one of each?

I have seen new 2m/70cm for as low as 300-350 for a mobile, if not cheaper, that work just as well as any of the others, just without all the bells and whistles. Check out the ADI, ALINCO, and AZDEN lines. Kenwood and Icom makes radios for all classes also. Another quistion is do you want a handheld or a moble/base?

Also consider the big stores like AES sometimes have great deals for display models/clearence items.

1111. ASTEC 62.5 AMP DC Power Supply

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-16 00:00:00 UTC
From: Buying <trout1000@squonk.net>
Message-ID: <eohkks45r3v8o8sin7l6ncb1738h5075fk@4ax.com>
Source record: 77309

These are well made power supplies from the
best power supply company in the world.

I'm selling ASTEC:
VS3-K0-K2-K3-00
Single Phase 85-264 VAC / 47-440Hz Input
Three slots for output:
Slot one 2v @ 150amps
Slot two 5v @ 150amps
Slot three 12v @ 62.5 amps

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

Page 3 of 6 shows chart to determine all watt
and amperage outputs as well as the number
of slots for each unit.

This page has other models for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Slot one is "C6" which is 28v @ 32.1amps
Slot two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

One other model:
VS3-D2-C2-20 is:
5x8x11 case
Slot one: 2v @ 240amps
Slot two: 2v @ 180amps
Price: $2,129

Selling these for $200 UPS "Shipped".
No lower on the price

Inquires via email only. Do not post to the newsgroup.

Thank you

Given Dean's input about the long wire I'd tend to go that way. There's
an outfit selling a spinning (fishing) reel attached to a "wrist-rocket"
type sling shot for launching cord over tree branches then pulling up
the wire. A "sloper" otta work but additional comments appreciated 'cuz
I'm facing a similar problem. TIA

Er, no. I'm not paying for the repeater access (although once I start
using it I'll probably help support it). I'm trying to get the radio
set up to use it without investing much $$, And I'm aware of the
CTCSS issue, I need to talk to the operators about that, rumor has it
there is a way around the problem (at least on that repeater).
I have two of these radios, from which I am building one working
model. One of them has a tone board, but I have not idea (yet)
which tone...

You can also look for a maring HF whip but they are very expensive. I think
there are some good loaded 35 footers out there.

The SGC-303 whip is expensive but very good product. The problem is it is heavy and therefore you need a very heavy duty spring to hold it vertical when in motion. SGC sells the complete antenna system by itself for way too much money in my opinion. The itself will work good if mounted and fed properly. $200.00 at AES. You can get a marine stainless fold over mount for about $35.00 at a marine supply store. I have seen the same ratchet mount in Cabela's in stainless and chrome for under $30.00. I found a nylon adaptor for this mount to fit the base of the whip. Problem is the SGC insulator and HD rubber encapsulated spring. They gouge you on that!!!!

The SGC whip is nice. It is electrically loaded to be 23 feet long and non resonant in the ham bands. This is what you want with end feeding for multi band use. If you do not operate with the whip up--you could not on the motor home if roof mounted anyway--you don't need the spring.

You said you have a metal roof--great!! Here is a good system that is not "tree" dependant. I assume you have a ladder on the back. Fix a PVC tube about 2 feet long near the top of the ladder and be sure it is insulated from all metal. Get a push up aluminum mast, such as the 12 foot Adventure or the 19 foot Traveler from AES. The are expensive, put collapse nicely for storage. Have you checked the price of aluminum lately? Mount the coupler on the roof and bond the ground side to the roof. Be sure all other metal is bonded to the roof, inlcuding the ladder, sides, bumpers, frame, exhaust, engine, etc. The object is to compensate for lack of radials for a counterpoise, but you can also hook up to the underground water pipes if they are metal, or run out some radials if you have the room and attach them to the frame. Attach wire to top of mast and put mast in PVC insulated holder on ladder and extend mast. Using a piece of RG-8 coax with outer cover and shield removed, attach this to coupler output and to mast with a hose clamp. Put an insulator on the end of the wire from the top of the mast and tie this off with nylon line to your mirror, or a nearby tree in front of the RV, or to another mast in the front of the RV. If you use the 19 foot mast, and you only go to your mirror, you would have over 40 feet of antenna to load up. Try to get as much up as you can for your nice inverted L. Be sure you get good conductivety throughout your mast. You could also use one of those telescopic fishing rods and just run the wire up through the fishing rod and out to your tie off point. With a good counterpoise, the SGC coupler will match automatically to all bands it covers.

Another option shown in SGC books is a horizontal loop on top of the RV using PVC standoffs, but I would prefer the L as this would give you both vertical and horizontal radiation, with low angle and near incident vertical sky wave for both dx and local coverage. The loop would work good for local but not very good for dx.

You could also go the High Sierra Screwdriver RV route as well, but with a metal roof and sides, I don't know how well that would work compared to an L.

Yup, the Ten-Tec can be modified. I also use
the President. My Ten-Tec contains 2 LO xtals
(20 & 22) and variable caps plus some changes
to the filter between the LO and the DBM
I get full coverage from 50 mhz to 53.700.
How do I get the last .3 MHZ out of the
president?

By the way, at $95.00 for the 1208 I don't
think you can beat the price, and it performs
great. 73 Ed AF2P

> is able to get 1000 QSOs is the winner.

Ah, but remember, it was a hypothetical situation. If the rules
actually stated that you had to transmit in Celtic and Gaelic - then
there might actually be people transmitting in Celtic and Gaelic.

But I accept your point - CW does actually have utility, whereas Celtic
does not(anymore, at least)

Hey Jeff - you are always into arcane stuff like CW, sailing, and the
breast stroke - I bet you know some Latin too.

Try that site and find out what band is used for the local machines. If like the last two places that I have lived, most machines are on the 2 meter band. You can get a 2 meter radio for around $200 plus another $40-60 for the antenna. Don't skimp on the antenna either. Get one that has good numbers(db gain, reliable). Good luck

From: Artur Leung <aleung@REMOVEittc.ukans.edu>
Message-ID: <394A7C44.C73CC465@REMOVEittc.ukans.edu>
Source record: 77339

Hi folks,

I am considering purchasing a booster amplifier for my Icom W32A dual-band HT. I searched through the web site and found the RF Concepts line of amplifiers. They seem to be pretty solid and well-built. However, there are several models and I am not sure which one I should get. My HT with the BP-173 battery puts out 0.5W at low-power and 5W at high-power mode. I came across the Mini-Amp 144P, 2-23 (or 223), and the 2/70. The 144P and 2-23 says 2W in gives 30W out, but it does not have a gain curve and I am not sure how much power I could get if I run 5W in, or if I will damage the unit. To make the matter worse, I couldn't find any information on the difference between the 144P and the 2-23. The 2/70 sounds nice to me, but I found that the 70cm band is not very active at all, and I am not sure if a dual-band booster amp will be as good as a 2m single-band one. Also, is the pre-amp feature a nice one to have? My HT tends to be easily overloaded by nearby paging stations and FM stations. But once I am away from them, it performs pretty well. Another question I have is what mode(s) will those amps accept? FM only, FM/SSB, or all-mode?
Thank you very much in advance for helping a new ham! 8-)

Tom,
The longer you make the 'whip', the better off you are.
'They' say anything fron a 102" whip, and longer will work,
and it will. Except on the higher HF frequencies the short
whips are going to be terrible! If you want to use the lower
HF bands (80,40,and 30 meters) you will have to havea whip
thats at least close to a 1/4 wave length(or equivelant, as in
a loaded whip). The tuner will tune the shorter whips, but
you'll be lucky to be heard at all...
'Doc
PS - Don't waste your money on the SGC whip.

1144. Who's using a Palm pilot for amatuer radio?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-16 00:00:00 UTC
From: TomR@astro.net
Message-ID: <394a85ba.65036020@news.idsi.net>
Source record: 77342

Hi gang,
I'm getting a Palm pilot IIIxe soon and was wondering if any of
you folks are using a palm for packet or any other ham radio use. If
so, what programs and where can I find them?

All replies appreciated!

73,
Tom - KB2SMS

2 capacitors and a coil, stuffed in a box. You can even do without the box.

Questions about the Icom T81A or T81E

Is it possible to modify the radio so it could tx on about 71.000mhz. We are known with removing three diodes on the USA verson and the Europa verson, but are unshore if the mod. will work the same way on both types radios?

Please help us with this problem. It means a`lot to know before buing one.

Thanks

Edgar

I used a Palm Personal a couple of years back for packet radio. Just used a serial port adapter and a KPC3. The software was just a plain-jane terminal emulator. There are tons of them on the net.

My MAHA charger does not work well with my
Yaesu 51R - never did and it works worse each
time I use it. The Yaesu charger works fine, so its
not the battery. The MAHA never charged it above
10.5 volts, and the charge never lasted as long as
when I charged it with the Yaesu wall wart.

BUT - I have not done anything to investigate the
failure and I have not contacted MAHA.
I can't knock them, based on one poor experience,
but I can't compliment them, either.

Message-ID: <j7g25.2992$OZ.616475@news1.rdc2.tx.home.com>
Source record: 77390

Hi everyone, I have for sale a Mint conditioned w32a that I picked up from a Pawn Shop and looking to pass it along to someone and make a couple of bucks. I have too many radios as it is but love to shop!! Comes with the manual and wall charger. The only ding on the whole radio is actually not part of the rig. The bottom of the battery itself has a dimple on it. May have been dropped when trying to take off the battery, not sure but radio is in perfect working order. I noticed it has the out of band RX and TX mods already done.

It has Alphanuemeric display if chosen and is pretty cool if you want to put in the FRS freqs. Very easy to keep track of that way. Dual inband receive capable. V/V U/U V/U U/V etc. I am sure if your intersted you already pretty much know what this radio is but if not just go to ICOM's page and check it out if you want.

Asking 210 or Best Offer. Thanks, Scott Hilton N0oba

Hi Fellas;
I have for SALE:
Heathkit HW-5400 transceiver(Brown Series) all solid state, 80 thru 10 mtrs w/warcs, plus the matching power supply and cables, has digital clock on the fave es speaker within.
I DO NOT have the manuals and I am not a technician, so I cannot repair it. It came from an estate. It is in very nice condition except there are scratches along both sides of each unit, seems like they were slide against each other causing the cabinet screws to deface the cabinets(covers)
Heres the Story: The power supply clock lights up but when the rig is turned on, there is a clicking sound coming from the back of the HW-5400, I think its the main relay, why its clicking is beyond me!
Price is $200 plus UPS from 11758
Thanks es 73....Rich WA2RQY (1961)

From: KG9QM@HAM.NET
Message-ID: <2Dg25.20$Rp4.58@news1.iquest.net>
Source record: 77395

I just got a Heil ProSet headset with the type "5" element. With the Mic gain full "up" I still don't overdrive the transmitter (not that that is my goal!). I have trouble tripping the VOX, even with the VOX gain all the way up, too. Even when practically swallowing the mic, the level seems too low.

Are the Heil elements "low output", relative to the needs of the 775DSP? I have seen inline preamps for ICOM, but I see those listed as for "older" ICOMs.

tnx,

don

You may wish to check into EVE on the above site. Consider removing the hardware mod and doing the software "opening". It took a couple of tries for me (even with a much more experienced guy). But mine is now fully open and stays that way. Good luck.

I looked on the web site about software open
mods and found nothing. Could you please
give a little specific information on what you
mean?

I also did the solder ball mods to a 3rd generation
VX5 and it lost ALL programming, no wide
band, no weather, it defaulted to ONLY the
ham bands and nothing would get it out of the
mode, not even removing the mod. I sent it
back to AES and they were stumped as well.
Yeasu hase it now and I hope to find out what
happened soon.

Source record: 77200

Hi Scott,

I hope you check out the ARRL link:

http://www.arrl.org/field/club/clubsearch.phtml

and find a good ham club in your area.

When I received my ham license a few years I checked out several
of the ham clubs in my area...

Each of the clubs welcomed a newcomer like me with open arms. I
did find one club that had a few "jerks", but that's true of any
club you might visit.

Remember Field Day is coming soon and you don't need a license
to talk on HF at a club's field day set-up. There must be
a licensed ham overseeing the operation, but that's not a
problem at Field Day. (Field Day is June 24 --> 25)
Please see:

http://www.arrl.org/contests/announcements/rules-fd.html

For all sorts of information on Field Day.

I sure hope you'll take the time to come to Field Day to a Ham
Club near you. It is a fun and a bit crazy, but I'm sure you
find it exciting and interesting.

Best Wishes,
Bob

Not positive, but don't think it will work. It will "tune there" I'm
sure, but I don't think it would actually receive 800 mhz. I don't think
the broadband receiver circuit goes tnat far. But I may be wrong. I know
my ft-470 will do the same thing, but actually only receives from
400-500 mhz on UHF even though I can make the readout go above 1 gig. MK

The first versions of the FT-530 would indeed do a fine job receiving
in the 800 MHz range. After the FCC edict banning radios that would
receive the cellular phone band, Yaesu re-did the 530, eliminating the
parts that enabled reception in the 800 MHz band. I have one of each
of these generations of radios.

Hi;
I just picked up one of these beauties and am looking to get a copy of the operators and service manuals. Specifically, and most immediately, I am looking for the following information:

1. Operators manual with general functionality of front panel switches.

I have not figured out the purpose of some of the more arcane buttons Like threshold, Offset, Time, Meas Cont, RDNG Offset, and Center Freq)in the "Entry" panel.

If you can tell me about these it will help somewhat.

2. List of error codes. Sometimes I get error codes if I make certain mode switch selections that apparently are in conflict with each other. Otherwise it seems to work well and no error lights are lit on the inside.

3. A service manual or reproduction including parts lists.

4. Specific parts list of the A1 input module. The unit I have has a slightly damaged (WECO?) coaxial 75 ohm input connector. I would like to replace this with a BNC if such option exists, or put in a new connector and find an adaptor to BNC. To do this I will need specific part numbers to reference to Agilent/HP.

5. Is there anyway to alter the time constant of the autorange function?

I would appreciate hearing from anyone familiar with this unit. I am using it as a VLF/HF receiver and for some subcarrier analysis.

1171. Motorola channel elements

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-17 00:00:00 UTC
From: ADAM154@webtv.net
Message-ID: <27434-394C43AC-89@storefull-213.iap.bryant.webtv.net>
Source record: 77210

I am trying to locate receive elements for the Motorola MT500, in the 160-161 MHz. range.

They are as follows:

*160.230
*160.290
160.320
*160.800
160.980
161.520
161.220

*indicates most urgently needed

I currently have some elements in the 154-155 range, as well as some UHF in the 450 range.

IS it possible to have these "re-crystalled?"

If so, please advise approximate cost and the names of any companies that provide this service.

If you can help, please respond via DIRECT E-MAIL ONLY...PLEASE. I do not plan on checking this NG for responses.

Your help is appreciated in advance.

From: TC Dufresne <tdufres@radiks.net>
Message-ID: <heY25.1423$j06.6468@newsfeed.slurp.net>
Source record: 77211

Wondered about a QRP project I was making, In the ARRL Handbook, page 30-24, there is a neat 6 watt transmitter described. Looks cool. One of the resistors (R18) is a "shunt" resistor. The description reads "meter shunt, 131/2 inches no. 26 wire wound on a high value 1-watt resistor"
Question-Is the wire connected to each end of the resistor, after wraping it around?
2) What is considered a high-value resistor?
Help!

1183. MORE MOTOROLA PROGRAMMING RIB BOXES !!

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-17 00:00:00 UTC
From: msisco9939@aol.com
Message-ID: <20000617015943.03919.00000965@ng-fy1.aol.com>
Source record: 77268

Yep !!

Found a few more "Brand New" Motorola Factory Rib Boxes. Still
in the Anti-Staic Bag, with original box and Instructions.

Can been seen in the photo:

http://www2.4dcomm.com/metrotech/mrbox.jpg

So if you have had a problem with a Home made or Clone Style Rib
Box, this will solve your problems forever. Most Clones are porbably
A-OK, however, with the newer series Motorola Radios, you would
be wise to have a Dual Power Supply Support system, as if you should
ever loose power during the write Mode, you may totally corrupt the code
plug which Motorola wants 199.00 min to fix. If you are considering a
polaris, try and get a Schmatic....They will not provide it ! It comes with
all Motorola ones.

$175.00+$8.00 For the Brand New ones (Only a couple of these)
$165.00+$8.00 For Ones that are in perfect Condition (Same as above/no box)

Will Ship Pirority Mail, Insured, With Delivery Confirmation

$29.50 For the Rib to Computer Cable (Or will supply a diagram for free)
pretty
simple to make, but if you desire one with all the supports and extras, its
cheap
compared to new

$22.00 For the Factory Power Supply (or I can supply a similar one, but you
have
to solder on the plug for 10.00

$2.00 for the Duracell battery

Or you may have the "Whole Package" listed above for:

$195.00+8.00 For shipping and handling, and add 10.00 if you desire the New
ones in the Box

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate
shipping is desired) or a Personal / Business check is A-OK too if you do not
mind a Short Shipping Delay due to bank processing time. This is required only
the first time or two as once you are in the data base, PrePayment is no longer
required

Plse, SW is availible "Only" through Motorola C & E, so if you need SW, it is highly recommended that you contact them and get the proper SW and Support materials.....It's Cheap compared to a radio failure.

LOAD RESISTORS for testing audio amplifiers:

I can supply you with 200 Watt loads - either 4 ohm, 8 ohm, or 16
ohm resistive loads as follows:

Each set-up would consist of FOUR 50 Watt resistors wired for the
correct load impedence.
These are brand new DALE Gold Series (the best resistors you can get!)
Each set-up rated for 200 Watts would cost $25.00 plus shipping.

I can also supply these as 100 watt loads in either 8 ohms or 16 ohms,
for $15.00 each, plus shipping

Source record: 77278

I modified my Yaesu VX5 as per one of the web sites. It involves removing 2 solder balls and adding one. Easy, except now Wide Band FM is blocked by what appears to be a solid signal or oscillation. I've checked the mod and there are no stray solder trails, etc. and the removed connections are indeed open.

1) Is there a news forum specifically devoted to either Yaesu or Mods
2) Anyone else tried the mod and had the same problem?
3) Any thoughts on the specific cause?

I will probably remove the change and do a reset, but wanted to ask first.

Dave

We have several CU-421/SRA-15 manually controlled shipboard antenna couplers that can be used as is or for parts. The are very conservatively rated at 500 watts CW. My guess they will handle much more. They use a pie circuit.

They contain one of each of the following major components.
10 to 300 uuf, 15KV Vacuum Variable Capacitor with drive. Jennings UCS300
50-5000 uuf, 2000VAC Air variable Capacitor Approx. size: "10" L X 6: W
RF coil 6 turn with variable loop
Meter
directional coupler.

These are unused priced at $350.00 FOB Somis
Supplied with a schematic and a copy of the parts list.
for more details please contact me directly.

Hello OM ,

I did read a disscription on ''mods.dk'' site how to set a Icom 2800H in crossband .
I tried several times but i don't succeed to set the 2800 in crossband mode .
Is this only for Asian Icom 2800H only ?

For the AN/GRC-9 HF Radio Set I have the following:

RT-77/GRC-9 Transceivers good used with protective cover $225.
GN-58 Generator good used $75.00 (less accessories)
LG-2 Leg./Seat for GN-58 new $25.00
GC-7 Crank for GN-58 new $ 12.50
AT-101.GRC-9 Antenna good non RL-29 reel $50.00
AT-102/GRC-9 Antenna good on RL-29 reel 50.00
KY-116 Leg Key(no cord) like new $50.00 new $65.00
CD-1086 Power cable like new $100.00 (only sold with RT-77)
J-37/47 Key New $50.00 in hermetically sealed box.
DY-88/GRC-9 Power supply (less dynamotor) with spares unused $150.00
I don't have dynamotors to reinstall.
I have limited quantities of each item available FOB Somis

if interested please contact me directly for further details.

1199. Ground floor apartment & 10 Meter antenna help needed!

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-17 00:00:00 UTC
From: "Michael C. Fortner" <N0YBC@prodigy.net>
Message-ID: <8igb4mueq1@newssvr03-int.news.prodigy.com>
Source record: 77284

I live in a ground floor apartment, and I am not allowed to put an antenna outside. I have been trying to use a 1/2 wave centerfed dipole, but that is not working as well as I would like (not a big suprise there). I want something inexpensive because at the moment I'm not planning on staying where I am past this 1 year lease. I don't have a lot of money to spend because of my 2 year old son seems to always need something new (like clothes, food, toys, etc.). Is there anything I can use indoors that will give me moderate success on 10 Meters with a 25W HTX100?

Thanks
Michael
N0YBC/4

Lord Valve Speaketh:
Really? Hmmm...the setup I supply with my Testbench Kit
($29 for just the load) has 2-, 4-, 8-, and 16-ohm settings
available, with 1/4" jacks for inputs and a switch for load
resistance selection. Of course, the 200-watt rating on
this setup pretty much limits it to use with guitar amplifiers
or wimp-city home hifi stuff. Mounting the resistors to a
metal chassis with some thermal grease don't hurt 'em
any, either.

Source record: 77148

I can't remember the exact words, but it is something like "Selective Accuracy".

When the Global Positioning System (GPS) was put in place, it was primarily for U.S. military use (targeting, position fixes, navigation, etc.). Civilian use was way down on the list of objectives.

To prevent use of the system for the same military objectives by 'the bad guys', the government degraded the system on a regular basis by reducing the accuracy of the positioning transmissions from the GPS satellites. The SA 'feature' is/was something that they could turn on and off at any time.

Recently, the US government decided (for a number of reasons) that SA was no longer necessary or desirable, and SA has been turned off on a 'permanent' basis.

A search of the web seems to indicate that vehicular EMI/RFI problems vary as much by model year as brand and model. That certainly seems to be the case with Toyotas.

>
>What bands are you operating that you have the noise on ?

I have HF antennas for 40 and 20, but using an RF probe I find the noise to be present, more or less at the same strength, on 40thru 10M. At 6M and above it is essentially a non-problem.

Below 40M the noise drops off quite a bit, although I can hear ignition popping down there at a fairly low level. The ignition popping is distinctly different from the noise that is the problem.

>
>What year is your Tacoma ?
>

2000 4WD XtraCab, 2.7L 4 cylinder, 5 spd manual.

Incidentally, there is no significant differnce in the level of the noise between driving and parked with the engine running, all fans, cruise, etc. off. The radio is still pretty much unuseable on HF.

1219. F.S. GAP Challenger DX 8 Band Vertical Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-18 00:00:00 UTC
From: Alan Gray <W3BV@arrl.net>
Message-ID: <394D0D14.CB8CE854@arrl.net>
Source record: 77154
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For Sale: GAP Challenger DX Vertical 8 Band Vertical Antenna. Brand new and unused, still in the factory carton. $200. U-ship from Zip Code 18910 (suburban Philadelphia)

Alan, W3BV

Description from GAP Web Site:

CHALLENGER DX

8 Band Multiband DX Antenna

Bands: 80m 40m 20m 15m 12m 10m 6m 2m

Bandwidth: Under 2:1 Entire band on 40m 20m 15m 12m 10m 6m 2m; 80m over 130 KHz; 10m over 1MHz

Height -- 31.5 ft.

Weight -- 18 lbs.

Radiation Efficiency : Exceed conventional verticals by up to 600%

Mount : Ground or elevated. A ground mount is supplied.

Counterpoise : 3 at 25 ft.

Ground Area Required : Fits in 10 ft. by 12 ft. area.

The Challenger antenna is the first production multiband antenna to utilize GAP technology. Thousands of Challengers are now in use throughout the world. From the jungle of New Guinea to the bitter cold of Finland to the brutal sands of Desert Storm, Challenger with its elevated feed links its user with rest of the world. Challenger is the first and only antenna capable of operating on eight separate bands from 3.5 MHz to 144 MHz. Its operating bands are 80m, 40m, 20m, 15m, 12m, 10m, 6m, and 2m. Over 130 KHz of bandwidth is provided on 80m. On 2m, the Challenger is a great base station antenna.

CQ tested the Challenger and established that on 2m, for example, its gain was approximately 6 to 8dB. On 40m compared to a mono band vertical, they found Challenger an S unit stronger. This is typical of the many reports received from amateurs around the world. Challenger is designed to be mounted directly in the ground or elevated. A ground mount is provided with each antenna. With the ground mount in place, the Challenger simply drops in. If necessary, because of space limitations, but not to improve performance, Challenger may be roof mounted since it does not require earth loss to obtain a 50 ohm match. Challenger

requires a counter poise of three 25ft. insulated wires. They may be buried or just scattered on the ground. Symmetrical deployment is no critical. Adding additional wire will not significantly improve performance. All of these are covered in a 16-page assembly manual provided with each antenna.

Obviously, you're correct. Of course, the ACS group *I* belong to has a bunch of cops(city/county/and state patrolmen and detectives), firefighters, EMT's, nurses and the occasional public utility guy like me; along with the retired schoolteachers, etc. Kinda blows away THAT theory.

I'd guess that the professionals have chased most of the wannabes away. The city/county/ state guys just keep asking us for more. No black eyes, sometimes a few sore muscles. I guess we no-codes and restructured HF'ers are doing THAT all wrong, too.

"...Fat, lazy,... " Hmmmmm, bunch of us were up "on the mountain" installing a new repeater/link system for most of the infamous "Black Saturday" (April 15, 2000). One of the cops and I were swaying in the breeze above the sight for 6.5 hours, hanging antennae and hardline. Fat, lazy, semiliterate people don't climb with me...but, then again, I became a professional (Land Mobile Radio) long before I became an Amateur.

You are right. It used a right angle mic connector. One of the pins
on a stereo type plug will trip the PTT (cause the relay to kick in
and transmit). The other lead is the mic hot lead.
Crystals if I remember correctly were in the 8 or 12 MHz region. On
the earlier HR2 or HR2A they used 6 MHz xtals for the transmitter.
The receiver used overtone xtals at 1/3 of the injection frequency.

It was manufactured in the 1975-77 time frame.

According to QST, it was introduced in the spring of 1994. I think I bought mine in 1995. It is an excellent radio for the money, and does a great job on 6-meters, the reason I bought it in the first place. It is one of the few radios around that has an internal power supply so it makes a good portable. It runs on from 85 to 135 VAC, or 187 to 265 VAC. I know a couple of guys that take them on DXpeditions for that reason. That is also the downside as you cannot run it off of 12 VDC without an inverter. The MOSFET finals won't run on 12 volts. It was reviewed in the April 1995 QST. It would make a fine starter rig.

Message-ID: <20000618195645.03705.00001862@ng-bj1.aol.com>
Source record: 77173

Yep:

Last of the Factory Motorola Program/Service Cables

These are not Cheap Clones, but are the Real McCoy for those
who do Professional Service on M1225's / GM300's / Radius Mobiles /
Maxtraxs / Desktracs / Ect.

All in perfect Condition (Checked Piror to Shipping)
Can be seen in the photo:

http://www2.4dcomm.com/metrotech/motomax.jpg

$55.00ea+$8.00 For S & H

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate
shipping is desired) or a Personal / Business check is A-OK too if you do not
mind a Short Shipping Delay due to bank processing time. This is required only
the first time or two as once you are in the data base, PrePayment is no longer
required

Monty

1239. Factory Original (NOT CLONES) Motorola Program Rib

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-18 00:00:00 UTC
From: msisco9939@aol.com
Message-ID: <20000618194948.03705.00001859@ng-bj1.aol.com>
Source record: 77174

Yep !!

Found a few more "Brand New" Motorola Factory Rib Boxes. Still
in the Anti-Staic Bag, with original box and Instructions.

Can been seen in the photo:

http://www2.4dcomm.com/metrotech/mrbox.jpg

So if you have had a problem with a Home made or Clone Style Rib
Box, this will solve your problems forever. Most Clones are porbably
A-OK, however, with the newer series Motorola Radios, you would
be wise to have a Dual Power Supply Support system, as if you should
ever loose power during the write Mode, you may totally corrupt the code
plug which Motorola wants 199.00 min to fix. If you are considering a
polaris, try and get a Schmatic....They will not provide it ! It comes with
all Motorola ones.

$175.00+$8.00 For the Brand New ones (Only a couple of these)
$165.00+$8.00 For Ones that are in perfect Condition (Same as above/no box)

Will Ship Pirority Mail, Insured, With Delivery Confirmation

$29.50 For the Rib to Computer Cable (Or will supply a diagram for free)
pretty
simple to make, but if you desire one with al the supports and extras, its
cheap
compared to new

$22.00 For the Factory Power Supply (or I can supply a similar one, but you
have
to solder on the plug for 10.00

$2.00 for the Duracell battery

Or you may have the "Whole Package" listed above for:

$195.00+8.00 For shipping and handling, and add 10.00 if you desire the New
ones in the Box

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate
shipping is desired) or a Personal / Business check is A-OK too if you do not
mind a Short Shipping Delay due to bank processing time. This is required only
the first time or two as once you are in the data base, PrePayment is no longer
required

Plse, SW is availible "Only" through Motorola C & E, so if you need SW, it is highly recommended that you contact them and get the proper SW and Support materials.....It's Cheap compared to a radio failure.

A friend of mine asked me to help him find out the value and help sell his son's old HW-101, Manual, Matching speaker, Matching AC supply, and Turner "Plus 3" desk mic. No Mods. The rig has been in storage for years and looks great! A couple of small scratches on the top cover, other than that, it looks brand new. Haven't tried it on transmit, but receive works ok with exception of some noisy pots and wafer switches. Great for collector wanting one that would be easily restored to mint condx. Asking $200 + shipping. (Any ideas if that's close to the going price???)

Most aviation radio licenses allow power up to 50 watts. To use a licensed
handheld in a base station configuration would really benefit from more than
the standard three watt output.

The kicker is the amp most likely needs to be type accepted (or whatever the
phrase is these days) for use in the aviation band and I doubt any of the
amateur amps would qualify.

Well, browsing around their site, it is evident that they are a
German company in Munich, they've been in business for 15 years, and they
are looking for represetatives to represent their company in North America,
thus I would guess they don't have a USA presense, just yet.

I have an interesting chance to purchase some nice RCA AM transmitters from the 1940's to 1950's (and possibly earlier) in various stages of completeness very, very cheaply before they are broken up for parts and surplus.

First of all, does anyone know what models were made in that era and can give me the numbers and data?

I need manuals ; i.e. ; Parts, service, mainenance, owners, installation, etc.

Are original parts and tubes still available? If anyone has anything that will work with these transmitters email me with what you have and prices.

They will be made to go back on air by a local non profit AM radio station.

Thanks,

1250. Help - using Yaesu mic on Kenwood rig

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-18 00:00:00 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <N4V25.6981$ds.176634@newsread2.prod.itd.earthlink.net>
Source record: 77212

I have a nice new Yaesu MD-100 A8X mic that I want to use on a Kenwood TS-850S. Of course, the pin connections on the plug are all different, and will have to change that. The question is regarding the DC voltage for the electret element. On the Kenwood diagram, it shows 8V on the connector. On the Yaesu connector, it shows 5 V. Is the DC voltage value for these electret elements critical, or can I use the 8V provided by the Kenwood on the 5V Yaesu mic element?

HMMMMMMM. I sold most everthig I brought to sell at the fleamarket, a couple things didn't move, thats ok by me, what gets my boxers bunched up are the tight ass f**kers that offer $25 for a XTS 3000, it's not worth more than that to them, but if it was on their table it would be priced even higher. Yes, I snapped up bargins on Thursday, maybe next year I'll start shopping on Wed., it is starting to be a good place to buy what you want because you certainly cannot sell to some of the morons there. Perfect example.... I had a used A7 spectra head on my table, priced right, a fella says to me, "didn't you have some new ones like this last year?" my reply was yes but I hadn't unpacked them he asked if he
could see one of the heads thatwas still packed up in the back of the truck, of course I asked if he was really serious as it was buried deep, of coure he had to see it before he could committ to the purchase, he kept wanting to know what it looked like, well... it looked just like the used one he had in his hand, only new. He was a mighty persistant fella, I finally told him to beat it, just another tire kicker in the flea market, probably didn't have all his change rolled up either. Just my .02, but after 3 days of that crap we didn't even bother setting up on Sunday. And yes, all prices are negotiable, to a degree, we all want a deal, remember, it's not where you styart but where you finish. SG

The ALINCO Model DR-610 is a dual band transceiver
covering 144mhz and 440 mhz and recievers am and fm across the band
The independent main band and sub-band operation permits
full duplex operation, w/crossband repeat abilities.
offers 30 memory channels (15 per band), high/low power,
four scanning functions, full reverse operation at a touch,
priority, call and ABX functions. The 37 selectable sub-audible
encode tone frequencies can be called for encode or
encode/decode (tone squelch CTCSS) decode optional.
Detachable front panel is easy to read and understand.
The LCD lets the operator know at a glance which functions
are in operation. Beep and bell tones can be added or deleted
as desired.

Thats about it in a nut shell. Comes with manual,
power cable and mobile mounting bracket, duplexer,
Air band rx and full 800 Mhz coverage w/ antenna connection.
£100 deliver anyway within the UK

1260. Re: Question about shunt resistors

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-18 00:00:00 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <394C814B.63F4C842@dialpoint.net>
Source record: 77222

The shunt resistor is common in homebrew rigs. Many meters that are easy to find and are cheep are 1 Ma. To make them read a higher value of current the shunt is used. AS it is normally a very low value for the higher currents it is easy to use some small wire as a resistor. You wind it around a resistor as it is a common form. It does not have to be a resistor but any form. YOu need to use a resistor about 100 times the value of the wire. A higher value is fine. The value is not critical. What you have is really two resistors in parallel and as the shrot piece of wire will probably be way under one ohm, a 1000 ohm resistor or higher will be fine. You loose about .1% accurecry that way.. way less than the meter is rated. Even 100 ohms will be just 1 % off. The wire is connected to the resistor wires in most cases as this gives a good place ot anchor the wire.

A regular low value resistor could be used instead of the wire, but it is difficult to find a very small value resistor at a cost most hams will pay.

YOu may also run into what is called a 0 (zero) ohm resistor on the printed circuits. This is just a jumper wire. Sometimes it is just a wire but in many cases it looks like a resistor. This is a jumper wire that is made that way so the automatic machines can install it.

1270. ASTEC 62.5 AMP DC Power Supply

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-18 00:00:00 UTC
From: Buying <trout1000@squonk.net>
Message-ID: <p6rpks8tnkue1qerahcfb8t2150138vsvb@4ax.com>
Source record: 77232

These are well made power supplies from the
best power supply company in the world.

I'm selling ASTEC:
VS3-K0-K2-K3-00
Single Phase 85-264 VAC / 47-440Hz Input
Three slots for output:
Slot one 2v @ 150amps
Slot two 5v @ 150amps
Slot three 12v @ 62.5 amps

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

Page 3 of 6 shows chart to determine all watt
and amperage outputs as well as the number
of slots for each unit.

This page has other models for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Slot one is "C6" which is 28v @ 32.1amps
Slot two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

One other model:
VS3-D2-C2-20 is:
5x8x11 case
Slot one: 2v @ 240amps
Slot two: 2v @ 180amps
Price: $2,129

Selling these for $200 UPS "Shipped".
No lower on the price

Inquires via email only. Do not post to the newsgroup.

Thank you

icom seems to be in denial about alot of things. in the most recent
issue of 'qst' the ARRL lab measured an output spike when the new 718
rig is keyed up. icom denies the existence of this spike which has
caused problems for owners of the 775 who tried to use it with several
amplifiers.

1272. Kenwood TH-D7A

Message-ID: <8iirdr$kn9$1@nntp9.atl.mindspring.net>
Source record: 77243

The TH-D7 is very functional. I have used it mostly in APRS mode and some packet. This radio takes a little getting used to since it has so many functions, but I am extremely happy with it. Some of the functions that Kenwood does not advertise is that this radio accepts control codes via its serial port: http://www.radiohound.com/control.htm and here are a few programs that make use of this feature: http://www.radiohound.com/d7zpinfo.htm . Another is that in addition to sending APRS messages, this radio can send very short E-mail messages over APRS. This radio has recently been upgraded to a TH-D7A(G). I would recomend purchasing this upgraded model. Here are the changes: http://www.radiohound.com/2000upgrade.htm .

I own two. One is hooked up to the internet for anyone to try. You will need Microsoft Netmeeting to view it, and Internet explorer to control it: http://www.radiohound.com/radio.htm .

Enjoy,

Walter
http://www.radiohound.com

> Floyd Sense - Angier, NC
You could add a little more resistance if needed to drop the voltage to
the element. The voltage is not critical at all for the element itself,
but if the rig's controls are set up for a certain mike drive, you want
to get as close to the other mike as possible so the mike gain etc,
works in the same appx settings. Also as a general rule, the less
voltage you use, the better, but I'd just equal what you had before and
see how it does. MK

For Sale or Trade:

Uniden SC-150B 100 channel programmable scanner. Instant WX, data lockout, 10-banks. 100% electrical condx. Looks very good, except minor rubbing of lettering. With AC charger/adaptor and manual. $85 + ship.

Also I have a pair of Radio Shack 100 mW 5-channel 49 MHz FM HTs. Working 100%, looks great, but one radio is missing one of the case screws from the back, easily replaced. $35 +ship.

I would prefer to *trade* this stuff as a lot for a 2M mobile or HT (needs to have PL & repeater splits, and 5W at a *minimum*, tone-pad and memories would be nice also) in good working condition.

> >

The FCC has pretty much left this issue to the VE's which I think
is correct. Some VEC's have offered opinions on "dot-dash" transciption,
but this is not binding on their VE's in the field. Personally, I
think applicants should be free to transcribe code in any way they
feel comfortable with, be it in Klingon, Naboo cuniform, Gregg
Notehand, or whatever including dot-dash provided the applicant
is aware that such copy is NOT acceptable as a "backup" in terms
of getting credit on the basis of consecutive character count in
the case of a failed comprehension test. To serve as a "backup,"
the submitted copy has to be in standard latin characters that
the administering VE's can read. Basically put, in our VE testing,

the transcription method used by applicant is academic if the comprehension test is passed. But if the comprehension test is not passed, a character-count "backup" has to be something that the VE's can read and these offbeat notation methods including dot-dash probably won't pass muster.

Hello Folks

I have an ICOM W32A HT. The other end of the wire that attaches to the center connector of the antenna is attached to a small white component that is attached to the p. c. board. The wire broke off right at the component. I would like to replace the component but I don't know what it is. Can someone tell me what it is. I am guessing it is either a small inductor or a zero ohm resistor. Thanks.

1295. Heathkit ET-3400 & ET-3400A (question about ETA-3400 option)

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-19 00:00:00 UTC
From: "Robert L. Doerr" <rdoerr@bizserve.com>
Message-ID: <394E26FE.C34DEB95@bizserve.com>
Source record: 77107

Hello,

I have two old Heathkit Microprocessor trainers. One is an ET-3400 and the other is the newer version ET-3400A. From what I can see there are only a couple differences between the two. The early version uses four memory chips, and a 6800 CPU while the newer version uses two larger memory chips, and a 6802/6808 CPU. Other than that I believe they still should operate the same way.

With these two units I have two ETA-3400 expansion options. I tried them both with the early version of the ET-3400 trainer and they work just fine. I have tried both units with the newer ET-3400A trainer and can not get either one to work. Both of the expansion options have the full amount of memory installed.

1) Is there anything special required to make one of these options work with the newer trainer ET-3400A?

2) When using the expansion option do you have to remove the existing memory chips from the trainer?

3) Does anyone have a copy of the manual for the 6809 daughter card?

Thanks in advance for any help on this.

Regards,

Robert

James: Typical prices for the complete group range from $300 to $400
depending on condition. If the AC4 is mounted in the Drake speaker cabinet
add about $50.

"B"-lines go for about $300-$400. "C" lines are generally $400-$600, but
for both, condition is the pivotal issue. Sherwood modifications and any
added filters will also affect the final value.

K5JOE,

You are now accessing newsgroups through a Deja account. It's not Netscape that is asking you for the ID and password. It's not USENET. It's MyDeja.

If you have been using MyDeja all along and are just now noticing the ID/password request, perhaps you have set/unset some option that keeps your login and password. I've not seen that. The whole purpose of Deja (from my perspective) is to be able to hit my account through a generic Internet connection at a library or such while on vacation. I surely wouldn't want my Deja account unprotected. The other reason I use Deja is the sporadic nature of what gets posted to/by my local ISP...but that's another OT question.

Hope this helps.

Yes, the VX-1R can operate at lower power (50 mW, as I recall).

==========
Hi Larry -- I have a Kent single paddle brass key. Tis tarnished as
brass does. The plastic paddle part broke and I replaced it with a like
size PC board material -- won't break for sure. Otherwise -- nice
condition. Reason for selling -- someone sold me a single paddle Bencher
for a nice price -- which I use now.

Make me an offer on the Kent.
New price is PL-PK103 KENT SINGLE PADDLE

Code was never intended to be a barrier. It was and is there as a part of the radio treaty signed several years ago. The only way it became a barrier is because people in "instant gratification" mode became too lazy to learn it. Any half-wit can memorize enough answers from a 400 question pool to pass a multiple choice test. That same half-wit can, IF he wants to badly enough memorize enough morse to pass whichever code test was the barrier to him. I know! I was one of those half-wits and all it took was the incentive to get it done. All the whining about too old, too sick or too whatever else is baloney. I did it all when I was 50+ cause I wanted to. Stop whining and "just do it".
W5KC said that...

Thanks to those who responded. I actually got the mod information on the suggested web site. I just tried restoring it to the original generation 3 settings (xxxooxxx) and I still have the WBFM problem. I presume that I either accidentally changed something else when I did the mod, or there is still a minute bit of solder between one of the posts. However, I've looked at it with a 20x magnifier and see nothing.

Everything else appears to have been restored (yes I did the power up reset). I guess that it's either use NBFM or send it back to YAESU. I hate to admit defeat however, so if anyone has any ideas first, I'd appreciate it.

My TS850 Tuning got harder to turn and then froze. The part
looks like a large pot with electron components in it with wires
coming out of it, It is called an encoder and it had to be replace.
Service charge was about $100. The part has 4 wires with a plug and
costs about $60. I put the old part in a vise but but could not turn
it.

1307. FS Collins HF-282 transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-19 00:00:00 UTC
From: jackgxyz@one.net
Message-ID: <394e7d81$1_1@news2.one.net>
Source record: 77119

Hello,
I have a Collins HF-282 1.6-30mHz transceiver. This is a channelized version of the HF-380. Radio has 20 channels. Same case and 100 watt output PA as the 380. Price includes service manual and power cord, which is identical to the 380.
Has LSB, USB, AM, CW tx and rx. Synthesizer has high stability oven. Radio has Collins mechanical filters for USB and LSB. Radio is in good operating condition. I can email pictures if interested. Price is $950 plus shipping.

Please remove xyz from email address if you care to email me.

Thanks for reading,

Jack, WB8BFS

Oh BS Carl. You're either divorced from reality or ... I don't know what. A major purpose of Amateur Radio was (and is) to provide a pool of skilled operators and in the days of spark-gap transmitters that meant skilled at code. However, by the time we had our best chance to expand our ranks during the CB craze of the 1970s code was on its way out in other services and many countries argued to drop it as an amateur requirement at that WARC; but no, U.S. hams lobbied so hard that it was retained and why did hams work so hard to keep code? For the sole purpose of keeping newcomers out!! Nobody wanted 1000's of new hams operating on their pet frequencies, especially when they might say "10-4" instead of "Roger"! They knew that other services would grab our bands (ie, use it or loose it) but the selfish SOBs didn't care so long as *they* had quiet freq's for the rest of their miserable lives and the only reason code requirements have been recently relaxed is that enough of them have gone SK that reason has finally triumphed over their selfishness.

And there is another kind of selfishness I find particularly despicable: the notion that everybody should endure each and every hardship I did to live as well as I do. You know the song: "If I had to learn code in order to *not* use it every else otta have to too!". Well, I have severe tininitis - tones louder than CW that come and go in my head. I wouldn't prevent me from learning 20 wpm but it does make it more difficult. Would it be fair to argue that everybody should have their ears boxed til they rang like mine before they take the test? I think not but it's the same arguement I see here daily. My $0.02

Bill

I have the ICOM IC-R8500 receiver and the ICOM software package to
control it.

Having used a different ICOM software package to control a PCR-1000
previously, my expectations were not very high before I purchased
the R8500 package.

I was pleasantly surprised! This package works very well!
I'm using it on two different computers, one is a notebook and
one a desktop. Both computers are infested with Windoze 98, and
the ICOM software has operated perfectly for me.

My only complaint is that I'm forced to use Windoze to use the package.
I'd be delighted if there was a Linux package to operate this radio.

I hope this helps!

Source record: 77127

About four or so years ago there was a company called R.F.
Electronics in South Carolina which sold solid state amateur
linear amps. They also sold kits.

Does anyone know what happened to it? Is there any company today
which designs and sells solid state amps for amateur.

After sixty years you would think more companies would get state
of art and start marketing high power FET amps for hams.

As it is now all the amps are TUBES.. a technology long ago over
run by FETS. Even our local FM station at 5 kw is solid state.

I'm not sure even if broadcasters in the low to 10 kw range are
still buying new tube type transmitters.

Only amp I am aware of is the Ameritron and its ghastly expensive
for only 400 watts cw. So does anyone have any info on any state
of art amateur radio linear amp designers or companies.

I recall over four years ago low cost HF fets were available that
could do 1kw output on 20 meters, yet no one has designed or
offered such an amp.
I think these FETs could be run at around 100 volts Vss making
them quite practical for HF linears.

1317. Re: Radio Shack HTX-404 Error Codes

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-19 00:00:00 UTC
From: Louis Bybee <louisb@datacomm.com>
Message-ID: <394EFB89.15A95A37@datacomm.com>
Source record: 77129

Go to http://www.radioshack.com/ProductSupport/Gateway/
click on Communications, then Two-Way & VHF Radios, then scroll down and
click on 190-1140 (HTX-404). You can then select a number of files
including one on Error Codes.

The Error Code #1 is listed as:

ER1: Internal RAM Error

ER1 indicates that the HTX-404 has detected an error in its
battery-backed up memory. This is most commonly caused by a low lithium
backup battery, but can also be caused by static discharge or a physical
shock. To clear the error, reset the HTX-404 by turning it off, then
holding down F + D while you turn it on again. This clears and
reinitializes memory.

If the transceiver frequently displays the error have the battery
replaced by an authorized RadioShack repair center.

I am posting this for a ham friend that is a bit new to the newsgroup thing.
Ross would like to trade the following
1 M2000 250 watt 10 meter amp
1 Digital systems 50 watt amp NEW
Laptop Avanti dx4 486 with a nice LCD display and disk drive works
flawlessly.
WOULD LIKE ANY HAM RELATED EQUIPMENT HF/UHF/VHF... ACCESORIES TOO. EMAIL
WITH WHAT U HAVE.. Please reply to
ross250@juno.com

thanks all

1326. Re: Looking for 28MHz-50MHz transverter

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-19 00:00:00 UTC
From: primetim@frontiernet.net
Message-ID: <8ik527$6q0a$1@node17.cwnet.frontiernet.net>
Source record: 77192

There's 2 ways that you could do it.

One is replace the processor chip with the one from an HR2510
and cut pins 34&35 and tie them to +5 volts. This will open the radio up for
full coverage from 26mhz to 29.999 mhz.Tying just pin 35 to +5 volts will
bypass the "CB" band channel spacing.

The other way is to install the "Chip Switch" which will give you 30 memory
locations and programable offsets. You'll have to install a battery backup to
keep the freqencies in memory when the radio is off , or, do like I do and
DON'T TURN IT OFF.
I had to modifiy my 2600 for ctcss once the chip switch was installed because
the repeater function on the front no longer worked.
Not a big problem though, just installed a mini-toggle switch on the rear
panel to switch the tones in or out. I also installed another switch to cut
out the voltage to the final. This reduces the output to about 300 milliwatts
to drive the transverter.
BTW, if you happen to have the book on how to set the tones, could you post
the switch positions for me? I didn't get an operators manual with the radio
when I bought it, I just have a service manual.

Thnx.

From: Joe Leikhim <jleikhim@nettally.com>
Message-ID: <39503C00.C6BE16F7@nettally.com>
Source record: 77001

You don't say what band you are experiencing drift. The TS950S hi stab option is .5 parts per million from -10 to +50C. At 14 MHz that is 7 HZ. At 28 MHz it would be 14 HZ. What you are describing does sound like a bit much since you are probably only seeing operation from room temperature, 25C to about 40C. Does it stabilize quickly, or continue to drift?

Ron Goldstein wrote:

<<About four or so years ago there was a company called R.F.
Electronics in South Carolina which sold solid state amateur
linear amps. They also sold kits.

Does anyone know what happened to it? Is there any company today
which designs and sells solid state amps for amateur.

After sixty years you would think more companies would get state
of art and start marketing high power FET amps for hams.

As it is now all the amps are TUBES.. a technology long ago over
run by FETS. Even our local FM station at 5 kw is solid state.

I'm not sure even if broadcasters in the low to 10 kw range are
still buying new tube type transmitters.

Only amp I am aware of is the Ameritron and its ghastly expensive
for only 400 watts cw. So does anyone have any info on any state
of art amateur radio linear amp designers or companies.

I recall over four years ago low cost HF fets were available that
could do 1kw output on 20 meters, yet no one has designed or
offered such an amp.
I think these FETs could be run at around 100 volts Vss making
them quite practical for HF linears.>>

I am thinking about buying an Alinco DR-605 dual band mobile. Does anyone
have any experience or opinions about this radio? I espically like the dual
receive and the cross band repeat features.
How is it on usability?
Is the display easy to read (both in bright light and at night)?
Any comments on the extended receive and ability to TX down to 430?
How are the VFO and memory scans? Fast or slow?
How is it with intermod (I live in an RF dense area)?

I can get it new for $320 (with PL decode), which is about what I can
afford, so it seems like a good deal.

Thanks!

So she's the pilot? Congratulations!

The amplifier would have to be VERY linear as its an AM signal you need
to amplify.
I have not seen a VERY linear amplifier for that band, and I doubt the
best SSB amplifier
for 2 meters would be good enough.

There are serveral companies now making solid state linears type accepted for amateur radio service. However you are correct, these were and remain the more expensive models. Check out SGC, Yeasu, Icom and Armitron. Also Communication Concepts, Inc. has been selling componets for years based on Motorola tech notes.

Not true Carl... At least, more not true than true...

In the late 20's or 30's, the federal government was concered that
the number of HAMs was becoming unmanagable. A director of the
ARRL, named DeSoto I recall, actually proposed 12-1/2 wpm as a
cw speed to 'limit the number of HAMs'. The government didn't
like a 'fraction' and 13wpm was the result.

TriEx (First Call Communications...see p. 140 of July QST) makes
great towers. The LM470E or LM345HD are all steel, very solid, and
reliable specs. Compare specs of other tower mfgrs are you will only
see wind ratings to 50 MPH, which is not really that much. TriEx also
specs their wind loading at 70 MPH, a much more reliable survival
factor. To put them up right, it takes a LOT ot of work, a big
footing, and a lot of concrete! The tower, and the labor/materials are
not cheap, but when properly installed the tower will last forever.
Good luck & 73, Dan K0DAN

**** YES! This software is now updated to reflect the April 15th
**** changes in FCC licencing structure for Amateur Radio. The software
**** contains questions for the new and old ham tests as well as
**** the unchanged professional tests.

Greetings!

dauntless-soft.com is pleased to offer high quality MS-Windows test
preparation software for the FCC/HAM plus some Professional tests
available for shareware download at http://www.dauntless-soft.com.
(aka http://www.hamexam.com -- easy to remember address--tell your
mates!) The program will drill you for the following elements:

ELEMENT
2 (NEW) Technician
3 (NEW) General
4 (NEW) Extra
2 (pre April 14, 2000) Novice
3A (pre April 14, 2000) Technician
3B (pre April 14, 2000) General
4A (pre April 14, 2000) Advanced
4B (pre April 14, 2000) Extra
1 GROL Basic Radio Law
3 GROL General Radiotelephone
7 Radar Endorsement - Ship Radar Techniques
8 GMDSS Radio Operating Practices
9 GMDSS Radio Maintenance

You are welcome to download this and give it a try. Secure online
registration is available--a $30 registration unlocks ALL the questions
and entitles you to FREE LIFETIME UNLIMITED UPGRADES of the
software. That's less than $3/test.

This software is based around the same engine that drives our FAA test
prep software that has helped many pilots score very highly on those
exams. (Yes, we got a new hobby and decided it was time to write
software for it, too!)

Thanks for your time. We look forward to your visit!

You answered your own question. Tubes are cheaper per watt than solid state. I can retube my Ameritron 811H for $85.00. I can buy it new for $795.00. Icom sells a SS amp 500 W for around $2500. I bet you couldn't replace the FET's for $85.00. When the price is competitive, it will replace the tube stuff. Until then the tube reigns supreme.

I gave it a shot, and being a ham is way too expensive for the amount of time I get to put into the hobby. With that said, I will be liquidating the few items that I was able to afford over the past few years.

This transceiver is practically new. I am the original owner, and have only used it in about 2 or 3 times playing with the auto patch. It has always been mounted in the trunk via the trunk mount kit (as soon as I remove it, it will be on ebay), with the display neatly mounted under the dash. The power wires has never been cut, and the antenna connector is still the original.

To check out the radio, just use the url below, or search for yaesu on ebay.

From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <8ioe6ioob1@agate.berkeley.edu>
Source record: 77075

My wife is looking at getting her tech license solely for aiding in local emergency use*(see note below) and communicating with me. I'm looking for suggestions for a simple, used, 2m HT with minimal bells (should probably have at least CTCSS, repeater offset, and DTMF pad). Dual band is acceptable, too.

I go back and forth between a newer, smaller unit she can carry easily, and a larger more robust one, that would be limited pretty much to the glove box.

note: * we live in an area not serviced by cell phones, so please don't suggest this instead of giving your HT comments. :)

thx,

I know, always suggest the Radio Shack HTX-202. Seriously, they're
almost everywhere. And a friend who got his HAM ticket just last
week picked one up at a pawn shop for $40. (I was marked
a lot higher (I think $100) but he made a series of trips over
the last 5 or 6 weeks and every day offered the guy, till he finally
took it!)

Well, I hate to tell you, but mine did the same thing. I undid the mod and still no go. I sent it back to AES and they could not get it going either. They sent it back to Yaesu and I am still waiting. Next time I will do the software mod over the hardware. Yaesu told AES that there is a new trap in the 3rd generation models that will force it to the ham only bands if you do any mod of of order (they wont say what order).

Good luck

1370. Boo on Icom

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-20 00:00:00 UTC
From: jwfrank@toad.net
Message-ID: <lqQ35.149$oH.1115@newsfeed.slurp.net>
Source record: 77079

Recently at a hamfest I asked an Icom rep about updating
the IC-756 to the IC-765 Pro. He said they weren't going to do
that.
So let's see how this works:
1) Icom comes out with a new radio, IC-756, and sells them to hams.
2) About 2 years after the above they come out with an IC-756 Pro
which is an updated IC-756.
3) Do they offer an up grade to the owners of original IC-756's? NO.
4) Do they offer a trade up coupon to owners of original IC-756's? NO.
4) Do they offer anything to owners of original IC-765's? Yes, indirectly.
They offer no chance of getting a decent value out of the lesser
capability radio when one wants to trade it or sell it.
In other words they say tough s... to all the hams that bought the
original IC-756.
Now look at the latest QST and see where Kenwood is offering
an upgrade of one of their HT's to the latest version. That is how
a responsible company operates.
You can guess which company I will NOT be looking at when I
make my next ham radio purchase.

>3) Do they offer an up grade to the owners of original IC-756's? NO.
The radios are really too different to do that. Did you have to buy a new car
or did you get an upgrade kit for your old one?

>4) Do they offer a trade up coupon to owners of original IC-756's? NO.
Nor would you if you could sell PRO's without doing so. Nor would anyone. The
purpose of a business is to make money for the owners.

>4) Do they offer anything to owners of original IC-765's? Yes, indirectly.

>come with a power cord. Seems to be a single frequency rig? (has a
>socket on the front for a crystal) Any information appreciated!

The 99'er is an AM transceiver.

The receiver is tunable from about 50-52 MHz.

The transmitter is crystal controlled, and as you noticed, there
is a single crystal socket on the front panel.

Power output, IIRC, is about 8 watts.

It uses crystals in the 8 MHz range and multiplies by 6.
An 8400kHz crystal would put you on 50.4.

The transmitter tuning controls are on the front panel.
Be sure it is tuned up.

I had one of these for a short time. Front end selectivity
was rather poor. FM broadcast stations came in about as well
as 6m ham transmissions. Try to find a low pass filter with a
cutoff above 54 MHz.

As ancient as it sounds, there is some 6M AM activity in various
parts of the US. 50.4 MHz is a popular frequency.

On the other hand, there's no way to upgrade a Kenwood 930 to a 940,
or a 940 to a 950, so I wouldn't get your hopes up about Kenwood.
Likewise, there's no way to upgrade a Yaesu MP to an MP Mark-V.

With the Icom, I suspect there were too many circuit changes between
the 756 and 756pro to offer a simple "upgrade." The pro model is a
very different animal.

Over the years, I can't think of many companies that have offered easy
ways to upgrade their equipment, with the possible exception of
Ten-Tec, and that's certainly not across the board with their models.

Don't feel bad. They did the same thing to the purchasers of the 706. It
failed to meet published specs but they didn't care. If you wanted receive
weather at 162.55 you were told to upgrade to a Mark II and lose $1,300.00
plus I paid for 706.

I have a DJ-162 HT which will only TX/RX in simplex mode. It will not TX/RX in duplex mode. Has anyone else had this problem? Can anyone tell me where I can buy a service manual for this radio.

Thanks
Bill

1379. Want Alinco manual DJ-580T

Newsgroup: rec.radio.amateur.equipment

Can anyone make a copy for me of the owner's and/or service manual for the Alinco DJ-580T? I have the radio and can't figure out some of its functions.

I am willing to pay copying and mailing costs, etc.

Thanks and 73,
Bob K6DDX

Well I'm sorry you feel that way but...

1) The 756pro is NOT an upgraded 756 its a completely different radio. Yes the name is the same but the 'guts' are different; its not some extra pieces added on thus the upgrade is not possible.

2) I'm not arguing that you will not get as much for your radio used since the 'new' pro has come out but if you have looked at the receiver spec's from qst test data you'll see that the 'old' 756 is actually better in alot of ways. I would not be so eager to get a pro if I already had a 756.

Weren't going to? NO. They probably told you that they CAN'T do that. Keep reading...

> So let's see how this works:
> 1) Icom comes out with a new radio, IC-756, and sells them to hams.
> 2) About 2 years after the above they come out with an IC-756 Pro
> which is an updated IC-756.
So does anybody and everybody else who manufactures/sells electronic equipment. Icom is no different. Why in the hell do you need the latest and greatest gear anyway? My XYZ brand VCR or TV have been phased out ages ago and there have been many models in between. I'm not trading my old stuff in, and I'm not buying new models either. My old gear works adequately. Christ, just look at the computer industry! If anybody should complain about obsolete products shortly after purchase it should be "power" computer users who have to upgrade literally every 6 months. They are not complaining because they know that's the way business operates. Nobody is forcing them to upgrade. It is their decision. Again, do you REALLY need 756PRO? If yes, then buy one. You are not going to get one for free. That's what you really want, isn't it?

> 3) Do they offer an up grade to the owners of original IC-756's? NO.
Not possible *at all*. Those two radios are similar only by name and style/front panel layout. Circuits are radically different.

> 4) Do they offer a trade up coupon to owners of original IC-756's? NO.
Did Ford offer a trade up coupon last time you were getting rid of your old car? NO! Would a Ford *dealership* offer some kind of trade in, or would they buy your old Ford. PROBABLY. Same thing is true for consumer electronics manufacturers, computer manufacturers, commercial radio manufacturers (marine radios, etc.). Point being, see if you can sell your old 756, or maybe offer it as a trade in at an Amateur store that accepts that sort of thing. But, why would you want to get rid of it in the first place?

> 4) Do they offer anything to owners of original IC-765's? Yes, indirectly.
> They offer no chance of getting a decent value out of the lesser
> capability radio when one wants to trade it or sell it.
Decent value? Humm? Why are you thinking in terms of resale value? You've bought 756 for your personal use as an Amateur Radio operator. It will serve you well for years to come, there is nothing wrong with the radio, and

(forgive me but...) if you don't abuse it, or tamper with it, it will probably work forever. Even 10 years from now it will quite adequately perform it's function: to allow you to communicate with other hams. And "classic" 756 does that job quite well. Did ICOM offer anything to the owners of original IC-756? They offer FREE technical support FOREVER. Part availability for a long, long time. They will even sell you the part, or discuss technical details about radio circuits with you over the phone. Many electronics manufacturing companies (computers, cameras, TV, whatever) would not take calls over anything else besides most basic operation questions. They most certainly wouldn't sell you proprietary parts (let alone send you some for free, ICOM is known for doing that sometimes), give you schematics or discuss component level troubleshooting with you over the phone. If you even mention something about opening the case your warranty would be void. Icom will honor your warranty even after you perform some mods on the radio, or service it yourself, AS LONG as you don't badly screw up the radio. Icom offers service manuals, 5 day turn around service time. Last time I bought a new brand-name computer I only had a 90 day tech support privileges and 12 months free service. Beyond that they wouldn't even fix it if I paid them. After 90 days I was supposed to call 1-900-whatever and pay $4 bucks a minute for tech support. You see, ICOM in fact has one of the best customer support policies around.

> In other words they say tough s... to all the hams that bought the
> original IC-756.
> Now look at the latest QST and see where Kenwood is offering
> an upgrade of one of their HT's to the latest version. That is how
> a responsible company operates.
Kudos to Kenwood on this move. But, those two HTs must be so similar that update is possible. 756 cannot be upgraded to PRO. Believe me, I've looked inside both of them, they are WAY different. Look at it this way. If that new Kenwood HT is so similar to the old one, why are they trying to sell it as a new product? See? You can turn every situation into a bad one. I'm not saying that it is bad. I'm merely saying that someone like you might see it as bad.

> You can guess which company I will NOT be looking at when I
> make my next ham radio purchase.
Heh-heh. Do you know of any other Kenwood radios which can be upgraded in a similar fashion? No. Your buddy-manufacturer for today is Kenwood, until they piss you off then you'll run off to Yaesu. Kenwood pushes new products out the door every year, same as ICOM, Yaesy and ALL THE MANUFACTURERS IN THE ENTIRE FREE WORLD. You are just pissed at ICOM because you'd like that new toy called 756PRO, and (gasp) you've just realized that you need to actually buy the thing. If you want the toy, if you can afford the toy, and if your wife will let you buy it, then by all means spend $3000 bucks. I don't think you should, and I don't think you have any reason to complain about Icom. If they and other radio makers weren't around, all of us would have to build our equipment like in the old days. If they start giving away free radios, or trade-ins, or big discounts, they would quickly go under, and me, you and everybody else in the Ham community would be affected. Like someone in this thread already asked, what planet are you from?

To answer that we would have to know how you are measuring the
calibration error of 10 Hz. Your 950 may be better than you think and
your reference may be the problem.

My Kachina 505DSP with TXCO will be in error in the order of 5 Hz or less
on a cold start based on a direct measurements against WWV carrier by two
methods, one involving an audible beat and the other an audio spectrum
analyzer first calibrated directly against the WWV modulation tone. With
the 1 Hz tuning of the Kachina, the dial can be set to the nearest Hz
which minimizes the error and that will be the limit of the error. Or I
can measure that error directly to the nearest 0.1 Hz with the calibrated
audio spectrum analyzer. I use the DigiPan program for this purpose.

After an hour or less the error is typically under 2 Hz and can be
calibrated by a built-in test-equipment routine to within a Hz or less.

My IC-765 is much poorer - I feel fortunate if it is ever within 10 Hz!

As if anyone would buy that old radio for $400! If you saved the packing boxes and materials from your other purchases you would not have to charge someone almost $9.00 for packing supplies! Just my 2 cents but I just shipped a FT-8000R that I sold on eBay for $335 for only $8 including insurance! Good luck with your auction.

1403. FS: CUSTOM FIT SMA-TO-BNC ADAPTERS

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-21 00:00:00 UTC
From: gulyas@netzero.net
Message-ID: <8irff9sof1@nnrp1.deja.com>
Source record: 76947
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

Do you have a need for an sma-to-bnc antenna adapter that is custom
made to fit and protect your H.T. or scanner radio?

Previewed in the May 2000 Issue of CQ Magazine.

Adapter allows you to:
Quickly change your antennas to base,mobile or different style use.
Use the more popular and wider selection available of bnc antennas.
Prevent chassis connector wear or from coming loose due to always
having to change antennas.

Adapter features:
Gold contacts for best connection.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The rubber base also provides an excellent support for all applications.
No need to remove once installed to make any antenna changes.

$11.95 + $1.50 S+H(Sizes to fit most radios)
For complete information and to view a photo of the adapter go to:
WWW.QRZ.COM(SWAP)(ENTER KEYWORD SMA TO SEARCH CLASSIFIEDS)
0R EMAIL: gulyas@netzero.net

I welcome any questions or comments at my email.
Thanks for looking at my posting.

I'll bet that's it. If you hear of anything, please let me know.
w2ut@airmail.net) In the meantime, it's NBFM, poor quality and all.
However, I'm really not limited just to the ham bands. I get everything
except WBFM. It's as if there's a strong local oscillation blocking
everything. If I go to NBFM or even AM, the stations are there.

Thanks!

I have for sale a Kenwood TS-50S in excellent condition. (little use/back-up rig)
The rig comes with original box, mobile bracket, power cord, carrying handle, hand mic, and operating manual.
The radio is very clean and operates 100%. It is also Mars/Cap modified.
Serial #41101353

Price: $520.00 plus shipping from 11710

I also have in excellent condition the matching tuner. (also used as backup)
It is the Kenwood AT-50 antenna tuner.
This unit is clean and operates 100%.
It also comes with the original box and packing, and has an extended connecting cable.
Serial #41000709

Price: $225.00 plus shipping

Will sell package for $725.00 plus shipping

Thanks for reading

The issue here is loaded Q versus unloaded Q.

Unloaded Q is the Q of the parts that make up the network.

Loaded Q is the Q of the network after it is hooked up to the
transmitter and the antenna.

When you design any resonant matching network you want to make the
ratio of unloaded Q to loaded Q as high as you can. The higher the
ratio the less power you dump in the matching network and the more
power you dump into the load when matched.

A low loaded Q means a wide bandwidth.

A high unloaded Q means you used a bunch of good parts in the network.

You can make the ratio high either by using very high Q parts in the
network or by using a low Q match circuit. Since you want as high a
ratio as possible generally you do both.

Depending on the type of circuit you use there will be a minimum
loaded Q to obtain a match. Otherwise you would simply use a very low
loaded Q and not have to worry about the Q of the parts in the match
circuit.

There are some neat charts in some of the old radio engineering books
that plot out loss versus the ratio of unloaded to loaded Q. In
general you would like to stay above a ratio of 10 if you can to keep
the losses fairly low.

Hope this helps

Gary,

You as an ICOM employee probably should not be publicly belittling an ICOM customer even if you think the customer may have dumb ideas. It is just a word of advise since I have heard that you are a ICOM service manager or something. I know it can be difficult sometimes but it may be best for you to bite your lip. I know you are probably writing on your own time but it can be risky in this day and age.

Good Luck,

Dave KG0US

That's OK, but it should have qualified it to say "lowest OPERATING Q
for matching two impedances in a simple network" or something to that
effect.

The loss statement isn't necessarily true, because other
configurations might provide lower loss than a restriction of always
having a single shunt inductor and series capacitor...which is what
you describe.

Nice try, but it just isn't true as a blanket statement.

>Finally, since the inductor is always parallel, the network always
>provides a two-pole lowpass response to provide harmonic rejection."

Woah. If the inductor is in parallel and the capacitor in series, the
system is a high pass network. While a high pass network MIGHT provide
addition harmonic suppresion with some sources and loads, it might
make things worse in other cases.

Even if the components are turned around so the capacitor shunts and
the inductor is in series, a low Q network might actually in some
cases reduce harmonic suppression. It just depends on impedances, and
what the rig likes to see on the harmonic.

>With regard to the statement concerning loss and Q, I had always
>understood that the higher the Q the lower the loss and the narrower the
>bandwidth of the circuit. Certainly Ten Tec has the second part correct,
>but they also seem to be claiming that a low Q setting of this tuner
>affords lower loss than would a high Q setting.

Q has many uses, ALL of which are correct. See the useful technical
parts of the thread on "radiation resistance" that are buried in the
whining and threats.

Q can be used to describe the "operating Q", which is different than the "component Q". Ten-tec is using "operating Q", while the single component Q has an entirely different result.

That is why I said, in other threads, Q has NOTHING to do with efficiency. A high Q system can be more or less efficient than a low Q system, or vice versa.

For example, my highest Q (when bandwidth is used to determine Q) mobile antenna has the LOWEST efficiency. On the other hand, I could design an even higher Q system that is more efficient than my high Q low efficiency system.

Q, because it has so many uses that many people don't fully grasp (like radiation resistance), is a great advertising buzzword.

>circuit 'efficiency', and circuit bandwidth in terms of Q seems
>intuitive enough to me, especially the trade-off between the two
>vectors. The instructions that accompany my present T-network antenna
>tuner seem to confirm this. They advise, having the alternative between
>*two* different settings of the tuner controls that both yield the same
>SWR, choose the one that has the greater amount of capacitance, as
>capacitors are inherently higher-Q devices than inductors, and thus
>lower loss.

They have the explaination backwards. You want the LOWEST Q component to have the lowest reactance, assuming the current are all equal in the components.

What they do have correct, but didn't say correctly, is you want the lowest operating Q....which in a C-L-C network occurs with maximum C.

An interesting thing is highest power handling for sustained high powers often does not always occur at least inductance in a tuner. Highest peak power rating occurs then, because capacitor voltage is lowests, but the losses in the inductor are "crowded" into a smaller area of the inductor and so inductor temperature rise in the contacts and wire actually can increase despite the fact efficiency also increases!

>The sheet goes on to say that such a setting will forfeit
>some bandwidth, necessitating more frequent re-tuning, but that this is
>worth it, because of the higher efficiency through the tuner, as well as
>the greater tendency of that higher Q setting to act as a bandpass
>filter/ preselector.

They have that wrong also. The exact opposite is true. Lower operating Q, which occurs when capacitance is maximum, results in MORE bandwidth....not less!

>I have seen numerous other such references to Q vs.
>efficiency/bandwidth in ham promotional literature (EX: "MFJ Super-Hi-Q"
>loop antennas", other antennas) Low Q equals wider bandwidth and lower
>efficiency [a dummy load being the ultimate proof of this] and High Q

>equals narrower bandwidth and higher efficiency, am I wrong?

Depends on what Q definition you are using. Q, by itself, has nothing to do with efficiency. For a fixed component Q, where all components have equal Q, lowest loss occurs with lowest operating (loaded) Q. For a system that has greatly different Q in components, lowest operating Q might not result in highest efficiency.

Q, like radiation resistance and other terms, is used so many ways that an advertising writer can make it mean almost anything he wants.

>I can't seem to get an e-mail response out of Ten Tec on this question,

Keep in mind L networks have the most restricted matching range of any network. C-L-C networks have the largest range, using reasonable size components.

Loss is probably the very least of your worries, but power handling might be a major one. Matching range certainly is a consideration, and L networks (and pi's) are poor in range when covering 160-10 meters.

All the manufacturers I know of bull$#@& people in advertisements, to a greater or lesser extent. You need to look at the system, rather than at narrow parts of what is going on, to make a good choice. Certainly it is nice to avoid letting hyperbole affect your choice, especially when the technical foundation is shakey.

I have three KW Johnson Matchboxes, a few Ten Tec tuners, an MVB-V, ATR-30's, and a shelf full of vacuum capacitors and large inductors. I always wind up using a "T" network and choke balun on the output to feed multiband antennas. The trick is finding a tuner that honestly rates the power. Most 3 KW tuners safely handle 700-800 watts CW, and some 3 KW tuners can safely handle 6 KW for hours!

You just never know, unless you look at the components. W9CF has a tuner simulator on his WEB page. I'd ask the manufactures what the Q and values of individual components are, and look at how much power is dissipated in each component using a simulation.

I'm sure many people here can tell you how much dissipation a given component can have. Since I have all the components, I might even be able to give you an idea of the component Q and dissipation limit.

Hi Joe,

No, it stabilizes after about 15 minutes. I check it at 15 Mhz, and it
can drift anywhere fron 5-10 Hz. The main problem is after it stops drifting, it
never lands in the same spot twice. Sometimes zero beat is 5 Hz up, sometimes 7,
sometimes 2.

Hi,
For sale a very nice condition Kenwood TS-940SAT. 100W ALL MODE
HF rig covering 160-10 meters. Built in antenna tuner. Has
notch filter, variable bandwidth tuning, slope tuning, cw pitch,
tone, etc. Built in 110 and 220 VAC power supply too.
High 5M serial number. Cosmetically a 9 out of 10.
Non smoker. Moving overseas and decided to bring the Collins
gear, so no room for this HF rig. Priced to
move at $875 + split UPS shipping (not to exceed $25).
You wont be disappointed.

Can demo on the air any evening, or come by for a look. Located
in Portland Oregon USA.

Thanks,
Joe K7JOE

For Sale. Pickup Only. Cash Only. Portland Oregon.

Hygain TH-3JRS. 20/15/10 600W triband beam. 3 elements on 12 foot
boom.
Complete. Assembled and on the ground. Used for less than a
year. Works perfectly. Moving overseas. No room to store it.
With instruction booklet. This sells for $289. Your price:
$150 -- you pick up, Portland Oregon. (available NOW!) Was put together
with penetrox so it can easily be dis-assembled and re-assembled.

Hygain TH-3. 20/15/10 2KW triband beam. 3 elements on 14 foot boom.
Complete.
Assembled and on the ground. About 3 years old. Moving overseas.
No room to store it. Sells for $329. $150 -- you pick
up, Portland Oregon. (available 6/26....using for Field Day).

Butternut HF9VX. 9 band (80/40/30/20/17/15/12/10/6) HF + 6M vertical
antenna. Complete and on the ground (still assembled). With
instruction
booklet. About 3 years old. Sells for $349. $150 -- you
pick up, Portland Oregon. (available NOW!). Assembled with penetrox,
so easy dis-assembly and re-assembly.

"Antron 99" 10 meter HF vertical antenna. Will tune 10-12 meters w/o
antenna tuner. Vertical whip, 16 feet in 3 sections. No ground radials
required. Brand new in unopened box. Won this at a ham-fest. Never
used it. $40, you come and get it.

thanks,
Joe K7JOE

You are confusing the intrinsic Q of the coil with the Q of the whole circuit when connected between generator resistance and load resistance.

The coil wire has a loss resistance Rw. The coil has a reactance XL at the working frequency. The coil Q = XL / Rw. We would like the coil Q to be as high as possible. For a given inductance the larger the physical size of the coil the greater the Q. So coil Q is a compromise between coil loss and finding the space to house it.

When the coil is part of an L-network to match a generator to a load, the load resistance is itself part of the circuit. The user has no control over the working circuit Q. It is just a measure of sharpness of tuning, of selectivity, which depends entirely on the values of generator and load resistances and, of course, on frequency.

1430. Question on how the PTT on a VHF mobile works

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-21 00:00:00 UTC
From: zirconx@my-deja.com
Message-ID: <8ipddfcbg1@nnrp1.deja.com>
Source record: 77003

Hello. I am trying to build an adapter to hook my simplex repeater controller to my ADI mobile radio. Right now it just has a regular phono and mini phono jacks coming out of it to hook up to an HT's speaker and mic jacks.

I understand the HT gets keyed up by simply closing the connection to the mic. Only two connections needed. Looking at the pin outs for the mobile mic jack, it keys up a little differently, it has a mic audio lead and a pin labeled PTT. So I guess that the audio lead would get hooked up to one lead of the mic jack, the other lead to ground, right?

But, the PTT pin, to key the radio do I hook that to ground, pin 8, or to the +8v signal, on pin 5?

I also need audio out to hook to the controller, I see that is also in the mic connector, pin 6. It says 100mv/10k ohms. Is that what the repeater controller would be expecting? Is that the specs that the speaker jack on a HT provides?

So I think I also need to come up with a way to key up the radio (using the PTT pin) when the repeater controller plays back an audio message. It expects the HT to key up automatically, but the mobile won't, because of the separate PTT signal used.

Thanks a lot for any help.

Ryan

1431. IC-735: Realignment of the BFO and PBT shift oscillator

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-21 00:00:00 UTC
From: Nicholas Bluhm <Nicholas.Bluhm@flinders.edu.au>
Message-ID: <8ipfegdpa1@nnrp1.deja.com>
Source record: 77004

I have too much treble in the USB compared to LSB on receive. I have to move the PBT control to "equalise" the frequency response. If 12 o'clock is neutral then I have to move the PBT control to 1 o'clock to achieve equalisation.

This is probably not helping my transmission frequency response either.

The IC-735 common service questions FAQ at http://www.icomamerica.com/FAQ/IC-735.html suggests a realignment of the BFO and PBT shift oscillator. I don't have a service manual so was wondering if any kind person out there could fill me in on the procedure for carrying out the alignment?

Thanks for any help!

Cheers,
Nicholas - VK5CX

1438. A strange claim made for the Ten-Tec Model 238 antenna tuner. . .

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-21 00:00:00 UTC
From: Will <wcwhite@mindspring.com>
Message-ID: <395092AE.B64F1849@mindspring.com>
Source record: 77011
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I was browsing Ten Tec's web site tonight
(http://www.tentec.com/high/htm) and ran across this little gem in the
description of their Model 238 L-network antenna tuner:

"Because there are only two variable components, there is only one
setting of each which will provide a perfect match to a given load
impedance. This unique setting automatically provides the lowest Q
network possible. Low Q means low circulating
currents, hence low loss, and it also provides the widest frequency
bandwidth of operation before retuning is necessary (very useful if
you're moving up and down the SSB portion of the band, for example).
Finally, since the inductor is always parallel, the network always
provides a two-pole lowpass response to provide harmonic rejection."

With regard to the statement concerning loss and Q, I had always
understood that the higher the Q the lower the loss and the narrower the
bandwidth of the circuit. Certainly Ten Tec has the second part correct,
but they also seem to be claiming that a low Q setting of this tuner
affords lower loss than would a high Q setting. The relationship of
circuit 'efficiency', and circuit bandwidth in terms of Q seems
intuitive enough to me, especially the trade-off between the two
vectors. The instructions that accompany my present T-network antenna
tuner seem to confirm this. They advise, having the alternative between
two different settings of the tuner controls that both yield the same
SWR, choose the one that has the greater amount of capacitance, as
capacitors are inherently higher-Q devices than inductors, and thus
lower loss. The sheet goes on to say that such a setting will forfeit
some bandwidth, necessitating more frequent re-tuning, but that this is
worth it, because of the higher efficiency through the tuner, as well as
the greater tendency of that higher Q setting to act as a bandpass
filter/ preselector. I have seen numerous other such references to Q vs.
efficiency/bandwidth in ham promotional literature (EX: "MFJ Super-Hi-Q"
loop antennas", other antennas) Low Q equals wider bandwidth and lower
efficiency [a dummy load being the ultimate proof of this] and High Q
equals narrower bandwidth and higher efficiency, am I wrong?

I can't seem to get an e-mail response out of Ten Tec on this question,
so I can't say if the above text is a misprint, or whether they in fact
are making the claims they seem to be making. I was leaning toward
making the 238 my next tuner, but absent better information, I am going
to defer the purchase. [an aside: Are the L and C components in the 238
are reversible as they are in some other L-network tuners (i.e.
switching the two variable components back and forth, exchanging their
positions in the circuit with each other)?]

All this is very disconcerting coming from Ten Tec, from whom I have always received excellent service for their terrific products (own a Scout and a great number of their kits, also a Triton IV and a 2591 HT; I am very curious to see how the soon-to-be-released Pegasus FP version of the Pegasus turns out, it looks very promising, and a bargain at the <$1200 street price!).

Message-ID: <39509648.57615ED8@arcormail.de>
Source record: 77012

Hi!
I bought a TS-850 a few weeks ago.
It has the YK-88C 500hz CW filter and the YK-88SN 1,8khz filter
installed.
The Manual says in the 455khz IF there is the option of either the
YG-455C 500hz OR the YG-455CN 250hz filter. But my 850 has a filter
which is nowhere mentioned in the
manual: the YG-455S-1. It says SSB filter on the label....
The point is I am doing PSK and I am not satisfyed with the bandwith
when selecting the 500hz filter...the bandwith is actually larger than
1,2khz...
I do also a lot of SSB operation, too
What happens if I replace the YG455-S with a YG-455C filter? does this
affect SSB operation negatively? I repeat...the manual says I have only
the option between two CW filters for the 455khz IF!

Would you replace the YG455-S or keep it? Any suggestions? Thanks

The use of the word obsolete makes me laugh. How can a amateur radio be
come obsolete see meaning of obsolete below, taken from Websters Dictionary.

obsolete: "no longer in use, practise or favor, out-of-date"

My two cents

Barry

I think you are confusing the use of the Q term.
Generally any inductor will have inherent resistance which lowers its Q by presenting itself in parallel (if I recall my EE basics correctly)
Q does mean quality, but likewise may mean L/C ratio.
In a tuned circuit the Q usually means how much current is flowing. If more current flows then for any inductor the I squared R, (power) losses will be greater.
The piece of junk MFJ tuners have Q's that change depending on what band they are tuned to. Mine had a heating problem in the coil and eventually blew up.

If MFJ had supplied a lower Q coil.. a big ole silver plated or maybe brass coil.. these heating effects could have been reduced.
RF usually travels only in the outer skin of inductors, hence the need to silver plate to keep loss low.

OK up till that sentence. You probably meant "higher-Q coil". To minimize coil losses, you want to use a high-Q coil in a low-Q tuned circuit. The higher the Q of the coil, the lower the losses. The lower the inductance, the lower the losses.

Darn Intel
Purchased a 282-12 in 1989 did they offer an upgrade to a 386 ? NO

Bought a 386-33 in 1993, at my own expense I tell you NO upgrade offer
by Intel !! Needed a new mother board for this one also new memory.

Bought a 486-33 still no upgrade path from the maker Intel, also
needed a new mother board here

bought a 486DX100 finally they get a clue was able to use the same
mother board.

Bought a pentium 200, well I have just about had it, no upgrade path
from Intel and needed another new mother board.

Bought a pentium II 350, now I needed not only a new mother board but
new memory and NO upgrade path from Intel.

Don't get me started about my 1996 Ford Ranger, cotton pick en Ford
keeps coming out with new models and NO FREE or Cheap UPGRADE path.
My 1996 is not obsolete it still does the same thing the year 2000
models do so why come out with new models ???

I can think of a number of reasons ICOM would not offer an "update kit" for the IC-756. First of all, the 756PRO is a totally different transceiver, making it impossible to offer an update kit. And, secondly, even if it was possible, why would they do it? An "update kit" to an existing product kills the demand for a new product. Come on guys . . . this may be a hobby for all of us, but it's a business for ICOM. Did Chevrolet offer an "update kit" on the earlier generation Corvette to bring it within spec of the new design? It's high time hams understood the economics of being in, and staying in, this business.

Come on John, give me a break... Do you expect GM to retrofit your
car every model year? (OK, Chrysler did to the original Viper owners.
But that was just to buy an ADDITIONAL Viper-GTS, not upgrade
the Viper RT/10. Hmm, OK, give existing customers first crack at
buying an additional radio, that's fair....)

Do you expect your computer company to promise you upgrades
every time they offer a new machine? (OK, some 'do', but really
think about that one!)

Hey, I'm sure ICOM will upgrade your radio! It's just a matter
of price! (Hmm, offer 10% of retail on your radio and trade it?)
But a TWO year old radio and you actually are complaining that
it can't be upgraded? Is this for real?

Mike

I agree completely. Icom can do whatever they want, it's their business. One thing that I have noticed though; Icom updates its rigs very quickly and when they do, the previous rig loses a lot of its resale value over night. For people who like to use a rig and then trade up or sideways, without losing much money, an Icom is not a good choice. I have an Icom 756 and a 706 MKIIG. I bought them for features and with the intent to hang on to them. Good thing too, because the 756 took a Huge beating in resale price when the Pro came out, and so will the 706 when its replacement comes out. This does not happen as often with Kenwood and Yaesu because they don't update as often.

somewhere in your owners manual you will find in tiny tiny print the
following: "specifications are subject to change without notice or
obligation" also if you read your warranty real careful it will tell
you that such upgrades are not covered either.

> and the narrower the bandwidth of the circuit.

Will, I am the first to admit this is confusing and here's why: They are speaking of *loaded Q* when describing their network. That is defined as R(load)/X(component), where 'component' is either the inductor or capacitor. A good example of loaded Q is the plate tank circuit of a vacuum-tube final amplifier. Since it is tuned to resonance, Xl=Xc and R(load) is the antenna impedance transformed through the step-up ratio of the tank, typically 100:1 (ie: 50 ohms ==> 5000 ohms). Recommended loaded-Q values for such a plate tank range from 10 to 20.

With the present tuner example, if one had an antenna impedance of 100 ohms pure resistance and matched it to 50 ohms with an L network with a loaded Q of 10, the required inductive and capacitive reactances would be 1000 ohms (approximately -- don't take this example literally). If the loaded Q were 100, the required reactance would be in the 10,000-ohm range, necessitating use of much more inductance, leading to more wire on the coil and higher losses. The capacitor would become smaller, obviously, but would have to withstand much more peak RF voltage since circulating current increases proportional to loaded Q while the capacitive reactance, through which that current flows, has likewise increased by 10.

Loaded Q only applies to resonant networks. The *unloaded* Q applies to individual inductors and capacitors and is the familiar X/R. Loaded Q is a double-edged sword - it's desirable for it to be low for lower losses but it's also desirable for it to be high for harmonic

rejection. In the tuner case, with a clean transmitter,
harmonic rejection is not required and therefore the
lower the loaded Q, the better.

Most mobiles need the PTT or "XMIT" pin to be shorted to "ground" pin to get the radio into the XMIT mode. These pins are generally seperate from the audio lead & shield pins in the mic jack, but Usually you can short the "ground & shield" pins togeather if nessessary, but the audio & PTT lines must remain seperate. There isn't usually enough/correct conductors in a "Speakermike" item to be able to directly wire it to a mobile radio.....Good Luck!

Hi Guys,

TenTec is the only vendor I know that provided an upgrade path
for existing owners. OMNI 6 guys could purchase the "Plus"
options. I think that this was counterproductive for TenTec from
a business standpoint but they did it anyway. The difference
being that the OMNI 6 is essentially the same platform as the
OMNI 6+ but the 756 and 756Pro share only the same cabinet and
model number. Icom owes no apologies. By the way, I recently
bought a new OMNI 6+ myself. Even though the comparitive feature
count is reduced - it's a fabulous rig and as fun to use as my
IC751a.

Hummmm, I don't have a 735..Do have a 730 though...Sounds like your
carrier oscillator needs adjustment. You will need a service manual for
all this, to do it right. I'd probably check the whole rig's alignment
one I got one. I once set this on my 730, right after I got it many
years ago. I did it a weird way though, I used a cal tone sent by the
730 to another receiver. I kept adjusting until boths sides exactly
equal. Been so long ago, I can't really remember much else about it. But
, it worked fine. I'm pretty sure I only adjusted the carrier
oscillator. I never touched the PBT ect. Maybe you will get some better
info... MK

David,

Box, peanuts and bubble wrap from Parcel Plus 8.92 (have receipt)

Shipping and Ins ($400.00 return receipt, 4 lbs to wa) $12.45 as per
their rate calculator on the web

Or a total of $21.37.

As posted on ebay, the shipping will cover shipping to any of the lower
48 states. So if you live closer to me, I will earn a buck or 2 on the
shipping. If I mail the unit to my neighbor the cost would be 17.52.

Al Wong
KF4GDD

PS: If you buy it, I'll be sure to spray the inside of the box gold, but
would have to add $4.00 for a can of paint.

I am looking for a tone encoder (model FTS-32AE) for a Yaesu FT-208R handy-talkie. If anyone has one, or an inoperative FT-208R with a working FTS-32AE tone encoder, I am interested in purchasing it. Perhaps other accessories too if you have any. Please respond to the e-mail address below.

Tnx & 73

1467. FT-847 DSP NR question

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-21 00:00:00 UTC
From: Clark Savage Turner <turner@rome.ICS.UCI.EDU>
Message-ID: <200006211117.aa16720@gremlin-relay.ics.uci.edu>
Source record: 77040

I have an FT 847 in my shack to check out for our satellite group
at my University. We just got it so I want to check it out before
we stash it for a few months (till we get up our antenna and room
to support the ground station).

I am fiddling with the DSP and notice that use of the DSP NR is of
little use generally. It appears to do very little as long as there
is any AGC action on the HF bands. I have to very carefully adjust
the gain to a low enough level and then use the NR, and if the other
station comes back at a different signal strength, I need to quickly
readjust or I won't hear very well.

Yes, I have gone through the menu and tried various settings for the
NR, from the default 7 all the way up to the maximum, and the problem
is the same, the adjustment is really critical to get any benefit
(on SSB or CW).

Is this the normal experience? I am used to a more aggressive NR
that works under all AGC situations in my Ten Tec rig.

Thanks for any info.

Al,

Thanks for your help. Someone told me that the schematic was wrong and that the part is a 2N6813 not 681. He also said that there are other errors in the schematic of this Astron RS-35. I better call Astron's tech support.

I removed the bogus part from the supply and checked to see if the voltage and amperage returned to normal. It didn't! So besides blowing the S0535W, something else has to be munged! Perhaps the regulator circuit? (I tried changing the 723)

By the way, I lost my old cross-reference materials in a flood last year. They were probably out-of-date anyway. Does anyone know if you can you get any of this data on line or is it available anywhere else? Times have changed!

I have a Yaesu 901DM that I am considering getting repaired --
currently not operational. This rig does FM on 10 Meters. Opinions on
whether a 10 <-> 2 meter transverter (model/type???) could turn this
rig into a decent all mode system for 2 Meters?

thanks for any suggestions,

Jay Tinkerton

When I saw your first post, I was going to say "run it without the SCR"
you'll just be without overvoltage protection. But, I see that you did.

Do you have AC on the transformer output? Do you have DC after the
rectifier/cap? DC on the Collector of the big-boy regulator transistors?
I am interested in your tale (I have a 35 and 50);

Just follow the voltage from the transformer towards the output. That'll
tell you what died.

cheers

>loop antennas", other antennas) Low Q equals wider bandwidth and lower
>efficiency [a dummy load being the ultimate proof of this] and High Q
>equals narrower bandwidth and higher efficiency, am I wrong?

Yeah, you're wrong. A dummy load is 100% efficient for turning RF into
heat, *which is what a dummy load is supposed to do*. Think about that,
and it'll give you a clue as to where you're going wrong.

An ideal tuner will couple 100% of the input energy supplied to it to
the *load resistance* presented to it. A less than ideal tuner will lose
some energy in internal component losses, and will thus be less than

100% efficient.

Eff% = 100 * Pout/Pin

Pout = Iout^2 * Rload

Pin = (Iout^2 * Rload +((Iout^2 + Icirc^2) * Rloss)

The second term there represents the loss through the component
loss resistances multiplied by the output current and the circulating
tank currents of the tuner circuit. The larger the value of X, the larger
the circulating currents will be, and the larger the losses will be, and
the lower the *circuit efficiency* will be.

Now Q = X/R, and R for the tuner *circuit* includes the load resistance,
Rload, where we *want* power to be dissipated, and the loss resistance
Rloss, where we don't want power to be dissipated. In other words,

R = Rload + Rloss

So an R of zero would be a *bad* thing (zero power is dissipated in a zero
load resistance), even though it would give us "infinite" Q (actually undefined
Q, but consider a very very small R, as it approaches zero, Q approaches
infinity).

Now remembering that a tuner is a tuned circuit, and the larger the value of
X, the larger the circulating currents in the circuit. These high currents repeatedly
suffer losses in the component loss resistances as they circulate. If we use a lower
X, we'll have lower currents through the component loss resistances, and lower
Icirc^2 * Rloss power losses in the tuner. So, X should be as small as possible while
still giving us the impedance transformation we need for the tuner to do its job.

Thus for best efficiency, we want the tuner *loaded* Q to be as low as possible
consistent with achieving the impedance transformation we need. At the same
time, we want the Qs of the *individual components*, which are just X/Rloss to
be as high as possible.

High Q *components*, low Q *circuit*. When TenTec talks about low Q, they're
talking about the loaded Q of the *circuit*, not the individual *unloaded* Qs of
the individual circuit *components*.

Why insure it for more than the selling price? What a waste of money.

1481. Antenna for Icom W-32A

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-22 00:00:00 UTC
From: grantcunningham <grant1@bigfoot.com>
Message-ID: <39524CA6.224F4236@bigfoot.com>
Source record: 76904

I'm looking for ways to improve my signal (who isn't?) when using my HT.
Right now I'm using the stock Icom antenna that comes with the W-32A.
There are various aftermarket alternatives, and I'm looking for feedback
from real people before plunking down the money.

I'm interested in both a telescoping unit (for the real problem areas)
and a better "rubber duck" antenna. Any and all recommendations appreciated.

Myron:

If it's an Astron RS-35 you're working on, I probably have a schematic for it.
If you would like a copy, just let me know.

Al, W2JUV

Any well stocked fastener sales outlet in larger cities would be able to sell you these over the counter.

If you don't have such available to you in your area I suspect the shipping would cost more that the screws!

If they aren't available in your city I would be more than happy to get them for you if you would mail me one sample so I can get an exact match.

It's a known problem with the FT-8000. I had one and had to send it back to Yaesu for repair. It was something fried in the front end. A friend of mine had to send his in 3 times. Each time the repair lasted about a month.
Good Luck,
Jim - WD0JIM

1487. Good emergency power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-22 00:00:00 UTC
From: Robert Joshua Chen <rjchen@Stanford.EDU>
Message-ID: <8itqg5ela1@nntp.Stanford.EDU>
Source record: 76910

I'm in the process of setting up a low-key emergency power supply (low-key, as in non-kw generators, due to limited space). I have an IC-706MKIIG I'd like to be able to power in an emergency situation for at least half an hour. My usage on 2m would probably be 4-10 watts with a TX draw of about 5-10 amps (7 average). I'm currently considering Pryme's portable power station (12 volt, 7 amp hour sealed lead acid gel cell battery). I would keep this trickle-charging off the AC outlet until I need it. Also, I'm thinking about getting some solar panels to charge it during a power outage. Any thoughts about this setup would be welcome including alternative suggestions--keeping in mind I have space limitations and don't need high power (<20watts, FM).

Thanks,
-Robert

Micor 2m conversion repeater
model 893RCB-3145B-RH52,
on 146.700/146.100,
100w solid state final,
new helical RCV filter installed/tuned,
with full duty power supply,
installed in cabinet,
with service manual.
Scom 7k controller w/ all options, (PL & patch),
recently sent in for latest firmware upgrade,
with user manual and windows software.
new price $900
Telewave duplexers, NEVER BEEN USED - NEW!
tuned for above frequencies,
model TPRD1556.
new price $1572

Total replacement cost is about $3972 - asking $2000 + ship
Serious inquiries ONLY

If you want more intelligent persons to speak with on HF, get rid of the CW exam and replace it with a Rubik's cube to "unscramble".

By choosing CW rather than mathematics, governments had choosen to limit HF hams to "robots" unable to think ! it's a choice ... accept the result ! :-)

The main problem for these "robots" is to think that thousands of PhD all around the world are going to access to HF bands without CW soon.

Clever people on HF : a new era for ham-radio !

From what I remember of my Dad's 901, I think there is a low level
output that would be useful for driving a traansverter. However, unless
you have the external VFO using it for 2M repeaters would be awkward
(unless you stay on one all the time). The problem is that the 901 does
not have the dual VFOs of later rigs that made it easy to work split.
You basically have one memory that you can set and use for transmit
while receiving on the VFO (or vice versa).

Al - don't be put off by these policemen (we have to put up with them in the DX pileups, too!) Just today I shipped off a linear amplifier (minus the transformer) from Oregon to Colorado (about a thousand miles). Shipping with special packing and insurance alone was $122.85 !!!!!

Some people just don't ship much stuff, I guess, to have a clue what it costs nowadays. Good luck on your sale!

Larry

I've had great results with my W32 using a Diamond RH77CA rubber duck.

It's about 15" inches long and it seems to improve receive signal a couple S units.

For Sale or Trade:

Uniden SC-150B 100 channel programmable scanner. Instant WX, data lockout, 10-banks. 100% electrical condx. Looks very good, except minor rubbing of lettering. With AC charger/adaptor and manual. $75 + ship.

Also I have a pair of Radio Shack 100 mW 5-channel 49 MHz FM HTs. Working 100%, looks great, but one radio is missing one of the case screws from the back, easily replaced. $25 +ship.

I will sell the above, but would prefer to *trade* this stuff as a lot for an older 2M FM mobile or HT in good working condition.

I've tried that, and it doesn't work the way a standard SWR
bridge would work (at least in my expectations).
Do you own one of these units? Can you look at the
adjustable caps on the SWR board and see if the wire
connecting them is soldered to the input wire from the transmitter?

1504. Re: HT suggestions for wife?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-22 00:00:00 UTC
From: Randy <kr6rc@arrl.net>
Message-ID: <3952EF8D.3BDF6CE7@arrl.net>
Source record: 76927

First I got 2 Icom 32A radios for my wife and myself, then I got 2 Yaesu VX-1R radios for us. 99% of the time we use the Yaesu's. I left one Icom in each of our cars for backup if we don't bring the Yaesu's.
The Icom has more power but she says the radio gets too hot to hold.
In informal tests with the two radios I couldn't tell any difference in range when we were driving in seperate cars. A friend of mine uses a VX-1R with a mag mount antenna for a mobile radio in his car and it works fine.
Right now I am using a Yaesu vx-5R for most everything.
All of the radios work well. Ask your wife to go with you to pick out her radio, that way she can hold them and see which one is easiest for her to use.
You may also think of getting a mobile radio for her car.
Randy

>Marco - DJ5KW
Hi Marco,
If you replace the SSB filter with a CW filter, you will not be able to
understand SSB signals--Bandwidth too narrow. I would install a YG455C-1 500Hz
filter. When you choose both 500 Hz filters your bandwidth "should" be slightly
narrower than 500Hz. You say you have the YK88C & YK88SN filters already
installed. I assume you mean the YK88C-1 & YK88SN-1. The filters without the -1
WILL NOT work properly.

1508. 2N681 Info in Astron power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-22 00:00:00 UTC
From: Myron Steir <msteir@earthlink.net>
Message-ID: <39515E51.5F6F9AED@earthlink.net>
Source record: 76976

I'm trying to replace a triac in my Astron power supply. The supply conked out completely while I was trying to get rid of some high SWR during transmit. No fuses blew. I think I narrowed the problem down to

a blown triac.

The schematic says that it is a 2N681. The triac I took out is in a flat package with the pins "C A G' from left to right with the manufacturer's marking SO535W. The triac I found in my spare parts bin that is marked as a 2N681 is in a round package with a 3/16 or so thread. I'm assuming that the threaded portion is the anode. Am I correct?

The reason I ask is that replacing the triac did not restore full power to the supply, only 11.75 volts which drops to zero under a very light load Therefore I either wired it in backwards or the spare triac is also not working.

Does anyone have the pinout diagram for this triac? Am I using the right triac or perhaps Astron threw me a curve. I'd like to be sure that I'm doing this right.

Thanks for any help,

Myron, W2EDY

I am not familiar with that unit, but the caps may work similar to other swr bridges and are to adjusted while connected to a good dummy load for zero or minimum reflected power. Then the resistors are adjusted for the correct power. You may need to reverse the antenna and load coax (feed power in backwards from normal) to adjust the power range of the reverse (reflected) power.

Myron:

According to my ECG Replacement Semiconductor Guide, the 2N681 is an SCR not a triac, meaning it conducts when gated during positive going cycles only. The ECG replacement is a type 5521. This is a stud-mount device, TO-48 case. The stud is the Anode lead. Of the two leads at the other end, the short one is the Gate, and the longer one is the Cathode. You can check your part with an ohmmeter (disconnected from the circuit, of course) by connecting the positive lead to the Gate and negative lead to the Cathode. This should indicate a low reading. Reversing the meter polarity will indicate an open or infinite reading.

If you want a direct replacement for the S0535W in the plastic package, it would be an ECG 5539.

Good luck and 73,

Al, W2JUV

1521. Low receive on Yaesu FT-8000R

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-22 00:00:00 UTC
From: WB3KUM/9 <d.breeden@NOSPAMwcom.com>
Message-ID: <39520BC1.D7A1A86@NOSPAMwcom.com>
Source record: 76989
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment

I just bought a Yaesu FT-8000R used. The seller fully announce this problem when selling it. After getting it in and trying it out, it seems a little deaf, exactly as described. A lot of fried eggs on receive. Other than this, it is in like new condition.

Has anyone seen this problem before and could you point me at a couple of thing to check before I consider sending it to the shop.

Many thanks in advance

Dennis WB3KUM/9

Bought a new ICOM R75 and noticed the AM synch detector didn't appear
to do anything. Searched the Net for the problem and found numerous
complaints that it didn't work- even in reviews. Called ICOM and their
tech acted like he never heard of the problem. He yelled over to
another tech- same response. Bullcrap. They know it doesn't work
worth a tinker's damn. He suggested I return it to ICOM. Send
a radio I have had for less than a week back to ICOM- for them
to return it and say there's nothing wrong?

Plain truth is that the AM synch detector on the ICOM R75 doesn't work
like it should. ICOM won't own up to it.

It doesn't matter if I sell it for $1.00, I will still insure it or the amount I paid for it as printed on my receipt. Why would you insure it for less?

Can anyone help a struggling ham on this question?

I am mounting a pre-amp < hamtronics LNY preamp tuned to 439mhz> on the tower near my 13' beam antenna.
I am trying to reduce signal loss from the lmr400 coax <185'> in the ATV receive only set up. Hamtronics indicates a shielded enclosure isn't needed, and advises it is mainly to keep the weather off the circuit. BUT.....if I don't shield the preamp circuit, wouldn't that essentially become a part of the antenna, shifting the tune of the antenna and causing swt problems?

Actually, I have convinced myself it would be unwise to not shield it. If I am wrong, please let me know , I can take it.
I am really concerned the 12 volt power wire that travels inside the shielded preamp box will couple with the feed line causing the antenna to be de-tuned.....Does this make sense? If so, would a feed through capacitor prevent this, and what value should I select?

Thanks in advance for any help, I'm working at becoming knowledgeable one question at a time!
It would help it you could cc my email in so I wont miss a response, kc5swi@home.com.

1526. Re: HOW MUCH DRIFT IS NORMAL ???

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-22 00:00:00 UTC
From: Butch Magee <butchkay@netdoor.com>
Message-ID: <39522A5D.594DAAD5@netdoor.com>
Source record: 76994

Does your 950 have the optional TXCO installed? I came in late on this thread, so you may have answered this already. My 950-SDX has the TXCO and I can't tell if there is drifting or not. I know this, the old geezers (which includes me :o) that check into the Mississippi Sideband Net each day, and the County Hunters, and the NTS net on 40 mmtrs., can be up to 100 cycles or more off frequency so there is no way to know using other hams for a reference. WWV allways comes in up to 5 Hertz off during the day, and I have to guess at the 5 Hz. 'cause my 950 don't show a Hz. at a time, so I suspect the difference is my ear anyway.
73, gud frequency counting, and God bless

>Hi all..
>Is it possible to open up this little quad bander for any extended rx?
>

Yes, it's a keyboard sequence that opens it up. Press and hold the
"Multi" and "Squelch" keys while turning the radio on. The best way
that I've found to ACCURATELY press the stupid joystick "Multi" key is
to press the center of the joystick with an opened paper clip. This
mod opens up the radio to the following:

50.000 - 75.995 Mhz AM or FM
76.000 - 107.995 Mhz Wide FM
108.000 - 135.995 Mhz AM
136.000 - 174.000 Mhz FM
174.000 - 229.995 Mhz FM
300.000 - 399.995 Mhz AM or FM
400.000 - 470.000 Mhz FM
470.000 - 599.995 Mhz Wide FM or FM
600.000 - 800.000 Mhz Wide FM or FM
800.000 - 824.000 Mhz FM
849.000 - 869.000 Mhz FM
894.000 - 999.995 Mhz FM

You can also open up the transmit by removing two diodes from the U.S.
version. This mod can be seen at...

http://qrz.com/download/mods-i-k/ict81.txt

Hope this helps,

Fred

Hello,
I just recently purchased a Garmin eMap GPS unit from a local retail store. However, they were selling mapping software but for $199.99 I believe and thats alittle outta my range.

Does anyone have software that I can use to link to the GPS unit so that I can have more detailed maps inside the unit. I need it for the Chicago Metro area...

Please let me know what you have and what will work for the unit.

Thanks for your time and hope to hear from someone soon.

You can go to this website and purchase software for the Garmin
EMap.

http:://www.gps4fun.com

You can also go directly to the Garmin site and buy it from them.

http://www.garmin.com

I know you'd love someone to provide FREE software to you
but this info is the best I can do.

(Heck, I have a Garmin GPS12Map and I'd love free software too!)

Good luck and enjoy your unit. Mine works great!

From what I have learned, yes. It is very similar front end. Per one person and Yeasu, it may be the duplexer(diplexer?) unit. These seemed to have been problemamtic for the information I have seen.

This is for the hams who also are interested in cycling also. I have a Blackburn Mag Track trainer that I would like to trade for a Kantronics KPC3 or KPC3plus. The trainer has 7 or 8 adjustments and magnets provide the resistance. If you are interested, please email me at kc5gwa@hotmail.com

1542. Help needed with automobile noise.

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-23 00:00:00 UTC
From: Chris Bellers <cbellers@swbell.net>
Message-ID: <h1M45.10$Hr4.5136@nnrp1.sbc.net>
Source record: 76860

I have a whole lot of noise (s3-s7) across the whole 10m band while driving in my 99 Toyota truck.

The noise is a constant high buzz, and it is not dependant on engine RPM. Efforts to control this via power supply filters proved to be unsuccessfull, as the noise appears to be radiated.
This was demonstrated by a friend turning on his HT while we were riding in the truck, and he has the same noise.

I'm leaning towards the electric fuel pump in the gasoline tank as the prime suspect.

I also know that Ford has issued a service bulletin on a filter to be installed *in* the fuel tank, but Toyota still has not come around to it.

My question boils down to this: Does anyone have a fuel injected Toyota vehicle made model year 94 or newer, who has successfully eliminated this noise source?

thanks in advance.
Chris Bellers

1543. Re: Toyota Tacoma RF Hash

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-23 00:00:00 UTC
From: Chris Bellers <cbellers@swbell.net>
Message-ID: <BcM45.12$Hr4.6183@nnrp1.sbc.net>
Source record: 76861

My 1999 toyota Tacoma PreRunner Xtracab (2.7L 4cyl) exhibits this exact same problem.

I can assure you it is the fuel pump in the gas tank. For proof of this, take any 10m HT and wrap some foil around it to attenuate the reception. stick the radio in the drivers-side real wheel well, and up on top of the gas tank (yes, there is adequate room) and you will hear the radio abolutely go nuts with that sound.

One thing that must be considered when doing the "turn the key to on and listen for the 1-sec noise" is that it is not the injector rail charging in this case, but it is actually the (ungrounded, by the way) electic motor of the fuel pump inside the gas tank. Thusly, the motor will only spin for the one second interval IF THE TRUCK HAS BEEN UNUSED OVERNIGHT, because the fuel system will need to depressurize in order for the pump to fire.

BTW, this is still an unresolved situation for me as well. any fixes for this would be greatly appreciated from this end of the net.

Heh.. sorry to say, this also effects my... well. my... my CB. *shame at having 11m*

Looking for answers that dont involve installing an aftermarket fuel pump,
Chris Bellers.

1544. Major differences between Patcomm-9000 compared to Kenwood TS-50 or Alinco DX70TH ?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-23 00:00:00 UTC
From: Gerald Bauer <Petra.Hein-Gerald.Bauer@t-online.de>
Message-ID: <8j05n3oka13$1@news.t-online.com>
Source record: 76862

Compared to TS-50 and DX70TH the transceiver Patcomm-9000 is very expensive.
I'm mainly interested in CW, which one is the best of the 3 transceivers
mentioned above ?
Is the receiver of the Patcomm-9000 better than the others ?

Regards,
Gerald

1545. WTB: 10A variac for home use

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-23 00:00:00 UTC
From: hopi@pro-ns.net

Source record: 76863

Hi.

Thanks for reading my post.

Would like to find a used, self-contained (non panel-mount) variac to manually dim an 8 amp light fixture. I'll be using this unit at home for photography purposes. Ordinary output sockets are preferable, as is an ordinary input cord.

Oh, and any suggestions you might have about which models to look for would be much appreciated.

Thanks!

DB

I have for sale an Alinco DR-600 Dualband mobile 5, 25 & 50w, this comes with the dual band antenna and a duplexer, also have an Azden 6m mobile 5 & 50w, no ant.

Price: $200 each shipped Prepay or COD. Good price for the dualbander, sometimes you can't find a single bander for that price.

Actually, Tom, we are both pilots. I assume your point was that it would be illegal for her to use the radio if she were not a pilot. Actually you are wrong. For aviation use, it's the Radio Station that (used to be) licensed, not the operator. Then, a few years ago, they did away with the licensing requirement entirely for USA use. Now, a license is only needed for offshore operations.

If you like CW, why not look at what is at the Ten Tec web site? That
would probably be a better choice than either the kenwood or alinco.
Don't know about the Patcomm. But all of these rigs have reviews at
the ARRL/QST web site, and QST always tests CW performance on any rig
it reviews.

Source record: 76871

I've been looking at the Alinco DJ-V5 and I have even
played with one for a few hours.
It seems like a very good value for the street price of
around $219.
The Audio seemed very good and the FM broadcast
stations came in great.
I like the 2+ watts with the $12 four AA battery case
and the unit come with the 5 Watt Battery for the
$219.00 price.

I didn't get it on the air and I'm wondering if it's is
good as it seems?

Thanks,

de KO6RO Tom

Hi Jay,
It would probably beat the pants off of today's DC- light rigs. The only problem I see is that transverters I am familiar with (DEM, MM, SSB) are really designed for a small segment of 2M and getting them to operate across the entire 4 MHz will probably be difficult. Most people use transverters w/ HF rigs because they want the very best in weak signal performance. Why not optimize the transverter for CW/SSB and pick up a cheap FM rig for 2m?

I have for sale TWO (2) STANDARD C-228A 144/220 MHZ handheld transceivers. I am the Original owner, non smoker, I have all the ORGINAL boxes, packing material, and Orginal manuals that look new. The 2 wall chargers are new I never used them because I used the Standard CSA160 drop in charger....These are all the items included..

1. TWO (2) Standard C-228A 144/220 MHZ handheld transceiver both in

Excellent Condition
2. TWO (2) Standard CLC-521 Leather Cases
3. TWO (2) Standard CNB-153 7.2 volt 1000mah batteries
4. ONE (1) Standard CNB-151 7.2 volt 700 mah battery
5. ONE (1) Standard CAW-150 cigarette lighter adaptor
6. ONE (1) Standard CSA-160 Quick Charger
7. TWO (2) Yaesu MH-12 speaker/microphones. Which work great on the Standard handhleds.

AGAIN THE EQUIPMENT IS IN EXCELLENT CONDITION, AND I HAVE ALL THE PACKING MATERIAL, AND ORIGINAL BOXES.......

.....$715.00 SHIPPED UPS INSURED IN THE UNITED STATES ONLY......

Thank You & 73,

I have in good condition two 212Z-1 Remote Amplifiers. These are solid state, 4 Channel AC or Battery operated portables in cases for on the spot broadcasts. Freq response 50-15KHz gain 90dB. These are excellent for AM Transmitters requiring line level audio input. Built in 400Hz tone for setups and program monitor for headphones. All XLR inputs and also telephone connections. With a really large VU Meter in the center makes it a real great addition to any station. $395 each plus shipping.

Tom, I'm pretty happy with mine. As you may have noted, it has a screw-on SMA connection for the rubber ducky antenna so if you want to use an older antenna, such as a telescoping half-wave with a BNC connection or a magmount antenna, you will want to get an SMA-to-BNC adapter with it. It does real well on transmit and I get good reports on sig strength and voice clarity.

For Sale: Motorola Minitor 1 Charger/Amplifier - NR!!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365749636

The Motorola charger is a single-unit battery carger/amplifier for the Motorola Minitor Alert Monitor Receivers which use nickel-cadium batteries. This unit will recharge nickel-cadium batteries either separatly, or while installed in the Minitor Alert Monitor. Two separate charging components permit both spare batteries, and batteries installed in the Minitor to be simultaneously charged. This unit contains a 2.5 watt audio amplifier and speaker, a rectifier and a series-pass voltage regulator in addition to the battery charging circuit. Also the unit has an external antenna input jack to improve area reception.The charger also has slotted holes on the bottom of the unit for wall- mounting. This unit is in excellent shape (9 out of 10 cosmetically). I just purchased it on eBay last week, not realizing it was for a Minitor 1, and I have a Minitor 2. Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365749636

From: Clint Bradford <clint@clintbradford.com>
Message-ID: <8j331k$8rr$1@nnrp1.deja.com>
Source record: 76809

> I'm looking for suggestions for a simple, used, 2m HT...

Instead of used, please consider a new Vertex VX-150. Commercial quality in a 2-meter HT. And HRO has the right price for them, too.

I suggest this one because it is a "mid-sized" unit for your significant other...not too small (and the VX-1r only puts out 1/2-watt), but not too large, either - I think this HT will be "picked up" and remembered/used more often than a full-sized counterpart.

- Clint Bradford, KE6LCS

I have an IC-R7000 communications receiver which is considered by many
to be top of the line.
IC-R7000 specifications:
Frequency range= 25-1000MHz,1025-2000MHz
Frequency control= CPU based digital PLL synthesizer.Direct frequency
entry.
Memories =99 tunable memories store frequency and mode.
Scanning=full scan,programed scan,mode selected scan,selected
scan,memory channel scan,auto write programed scan & priority scan.
Frequency readout=7 digit fluorescent.
Frequency resolution=SSB,FM/AM,owner selectable
100Hz,1KHz,5KHz,10KHz,12.5KHz,25KHz all modes all bands.
Frequency stability==+or- 5ppm @-10c to +60c
Power supply=117 or 240 VAC
Receiving system=25-1000 MHz FM-N/AM/SSB triple conversion,FM double
conversion:1025-2000 MHz,FM-N/AM/SSB quadruple conversion,FM-W triple
conversion.

I will ship to the lower 48 for $700.00

Hi all...
I've found a wire cutting mod for the TH-D7e that allows extended tx and rx
but is there a combination of buttons that can be depressed whilst turning
on for ext rx, so that the wire is not required...?

1592. ASTEC 62.5 AMP DC Power Supply

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-24 00:00:00 UTC
From: Selling <trout1000@squonk.net>
Message-ID: <7vlalsg0lb05h200kalultmf31nj71ljuh@4ax.com>
Source record: 76813

These are well made power supplies from the
best power supply company in the world.

I'm selling ASTEC:
VS3-K0-K2-K3-00
Single Phase 85-264 VAC / 47-440Hz Input
Three slots for output:
Slot one 2v @ 150amps
Slot two 5v @ 150amps
Slot three 12v @ 62.5 amps

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

Page 3 of 6 shows chart to determine all watt
and amperage outputs as well as the number
of slots for each unit.

This page has other models for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Slot one is "C6" which is 28v @ 32.1amps
Slot two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

One other model:
VS3-D2-C2-20 is:
5x8x11 case
Slot one: 2v @ 240amps
Slot two: 2v @ 180amps
Price: $2,129

Selling these for $200 UPS "Shipped".
No lower on the price

Inquires via email only. Do not post to the newsgroup.

Thank you

<< Just took delivery of a new Toyota Tacoma, and am installing an Icom 706MKIIG
in preparation for a cross country trip. >>

M.J.-

If you don't mind telling, I wonder how you routed your battery power wires from the engine compartment into the cab?

I'm trying to figure a way to route the wires in my Toyota Corolla. I found where there is a cable bundle directly behind the console, but can't manage to get a hand anywhere near it. Are there any other accessible channels, such as through the fender walls?

Thanks.

I found it very hard to tune. The unit required a very strong
signal and on CW the spacing had to be almost perfect otherwise
it delivered gibberish. Most amateur CW is poorly spaced.

I never was able to decode anything in the other modes.

Would it work? Yes

However, remember that 10m is 28.000 to 29.7 (or in the case of an older rig, probably 30.000. So if you were looking to do 2M cw/ssb the rig would be ok. However, you will still not make it completely into the FM subband as you top 2M freq would only be 145.700MHz, and you still need to be able to do offsets and PL-tones.

If you are looking to do FM, it would probably be cheaper just to by a used 2M HT.

Good Luck!

1618. Yaesu FT-50R bug?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-24 00:00:00 UTC
From: Seth Miller <sethmiller73@email.com>
Message-ID: <3954C9C5.8180AEF3@email.com>
Source record: 76895

There is a known bug with the early model Yaesu FT-50 series that causes current to be drawn from the battery when the unit is tuned off. This was later fixed, and a mod published to repair older units (involved a single component change, if I remember correctly).

I have a later-model FT-50RD, with a s/n well past the production range for

the fix, yet for the past year or so I have noticed the same symptoms of the problem (battery drains when unit turned off) on a very intermittent basis. It has been very difficult to troubleshoot because it happened only occasionally, but I have now determined the cause.

Normally, the unit draws about 0.2-0.3 ma when turned off. I assume that this is the normal quiescent current draw for the unit, and it causes no problems. BUT, when I turn the unit off when a memory channel is selected that has the CTCSS decode function enabled, the unit continues to draw 11 ma when turned off! If I turn off CTCSS decode and re-save in the same memory position (changing nothing else), the problem goes away. It is easily repeatable at will. This is why I only rarely noticed the problem - it only occurred when I happened to turn of the radio on a memory channel programmed with CTCSS decode.

So, now I wonder, is this problem still lurking out there? Can someone else

give it a try (program a memory channel with CTCSS decode, save it, then turn off the radio and measure current drain). Could this weird bug be in just my radio?

Also, if anyone has detail concerning the original Yeasu-recommended mod to

fix the early radios I would appreciate receiving the information.

Thanks -

- Seth N6BMB

1623. Yaesu FC-1000 with Icom IC-756?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-25 00:00:00 UTC
From: Igor Dobrokhotov <un7gm@qsl.net>
Message-ID: <8j5dd0$qt1$1@mail.nursat.net>
Source record: 76750
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi folks,
I've bought Yaesu FC-1000 Autotuner for a very reasonable price. The question is how to use it with my Icom IC-756? I suppose what the better way is making PIC converter Icom/Yaesu tuners digital exchange protocol for troubleless using Yaesu tuner like genuine Icom . If anybody has an experience with solution of same problem, please let me know.
73! Igor UN7GM

Anyone got any inside info as to when this new rig will be in production ??
The spec looks v e r y interesting and should give the 847 a run for it's
money
FWIW, I think the dual receive is one of the best potential features

Paul

Based on my experience, you can use any yaesu mike with the cable installed. I'm using the Heil Micro-Pro headset. It is a stock microphone, so I would say any one will do that has the round 8 pin connector.

Yep !

I still have a few of these left. Motorola's Surveillance Kits
used by the FBI and CIA. Will fit almost "Any" Motorola portable with the
correct adaptor, or will fit directly into a Expo, P50, as it mates with a 6
pin axial mini jack.

Has a External Mic, External Ear phone, and Small External PTT Switch all
super high quality.

From Motorola these are $275.00ea, and even Wholesale they are over $200.00

These are Brand New sealed in the original bag.

$65.00ea + $8.00 for shipping and handling. (Photo on request)

Also, just found the part number off the HT600 / P200 / MTX Series radio
for the above (NTN5560B) $46.50 from Motorola

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate
shipping is desired) or a Personal / Business check is A-OK too if you do not
mind a Short Shipping Delay due to bank processing time. This is required only
the first time or two as once you are in the data base, PrePayment is no longer
required

Almost anything will work if wired for the radio. The old kenwoods very non picky on mikes. Even a good quality dynamic CB mike would probably sound fairly good. An electret condensor in an old mike case would work also. The mike impedance wide range. Will handle low or high impedance mikes. The matching hand mikes for the 530 are the mc-30s and mc-35s, if you really want the kenwood mike for looks/matching reasons. MK

Hi Gang,

I have for sale a Kenwood TS-120 HF Transceiver. You can see a picture
at:

http://members.home.net/ke3ok/My_Photos/000417-003.jpg

It covers the 80, 40, 20, 15 and 10 meter bands. It works great and
would make a great mobile rig. The front panel is in great shape but
the cabinet has scratches. It comes with the mobile mounting bracket,
users manual and a copy of the shop manual. $250 plus shipping from
50315. Payment by US Postal money order only. No COD's. Personal
checks will be returned un-cashed. Thanks and 73,

Al

Hi Gang,

I have for sale a very nice Hallicrafters SX-110. You can see a
picture of it at:

http://members.home.net/ke3ok/My_Photos/000314-018.jpg

It is in great shape and everything is there. It covers .54 to 34 MHZ
and works on all bands. There is a sticker on the top of the cabinet
that could be easily removed. As you can see from the picture there is
a small bend in the edge of the cabinet in the lower left corner that
could be straightened. Other than those two small problems it is in
great shape. I'm asking $125 plus shipping and packing from 50315.
Payment by US Postal money order only. No COD's. Personal checks will
be returned un-cashed. Thanks and 73,

Al

1676. Help in designing a 50-100W linear

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-26 00:00:00 UTC
From: WB3KUM/9 <d.breeden@NOSPAMwcom.com>
Message-ID: <39577E44.5F4AF7B0@NOSPAMwcom.com>
Source record: 76697
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I am trying to design a 6 meter linear. 6W is really tough to compete with. I settled on using 6146, several people have recommended this and I have received no comments on a solid state option. My current stumbling block is the -50V 1st Grid bias supply. Most of the time the grid bias is set the floating the cathode above ground. But 50V is a bit much. Kenwood uses a separate bias supply and I believe Heathkit does also. If I had a 12V filament supply I could use a voltage quadrupler, but the the supply is 6.3V and X8 is a bit much. I would like to not install a second transformer for this. Has anyone used a DC-DC converter (5V to 50V) to obtain a bias reference. This would be similar to Kenwood generating 28V in the TS-700's for the finals.

Many thanks in advance.

Dennis WB3KUM/9

The ALINCO Model DR-610 is a dual band transceiver
covering 144mhz and 440 mhz and recievers am and fm across the band
The independent main band and sub-band operation permits
full duplex operation, w/crossband repeat abilities.
offers 30 memory channels (15 per band), high/low power,
four scanning functions, full reverse operation at a touch,
priority, call and ABX functions. The 37 selectable sub-audible
encode tone frequencies can be called for encode or
encode/decode (tone squelch CTCSS) decode optional.
Detachable front panel is easy to read and understand.
The LCD lets the operator know at a glance which functions
are in operation. Beep and bell tones can be added or deleted
as desired.

Thats about it in a nut shell. Comes with manual,
power cable and mobile mounting bracket, duplexer,
Air band rx and full 800 Mhz coverage w/ antenna connection.
100 deliver anyway within the UK

I've got someone that has asked me to help them with a problem. She manages a channel on the local cable system that basically has advertisements and community information 24 hours a day. She is planning to move outside of town and will not be able to be connected to the cable system. She would like to be able to view her channel at her new residence which will be about 3 miles line of sight from the cable system's head end (which is where her equipment is located).

Does anyone know how this can be done somehow? It probably doesn't matter if it ends up on the same channel on her TV or if it ends up coming out of a RCA style video jack that she could plug into a VCR. She would only need the video portion of the channel.

I don't know if there would be any legalities involved in this with the FCC, etc.

Any help or ideas would be appreciated. If there are some commercial products that would do this at a reasonable price, please let me know.

Thanks!

1681. Fooled by MFJ 259B

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-26 00:00:00 UTC
From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <8j88i2$4aa$3@agate.berkeley.edu>
Source record: 76702

I have been fooled by measurements with my new MFJ-259B SWR Analyzer. It was saying that my 2m 15el beam at 45' was purely reactive, that R=0 and X~60, and read an SWR of ~ 10. This concerned me, as I thought something must be wrong with the antenna or the feedline or the connection at the feedpoint..

I made an independent measurement of the VSWR with a directional coupler and it was OK, less than 2:1 across the entire 2m amateur band. Humm...

So, I then connected a short piece (~0.5m) of coax from my MFJ Analyzer instrument to a small (4el) hand-held 2m yagi and walked around with it. In the house the SWR was fine, and the impedance was reasonable, both R & X (mostly R, a little X). Outside by the front door, OK, too. On the roof, that is another story. Suddenly the real part R went to zero and it read purely reactive, with high (and fluctuating) SWR! And, this effect was directional, if I put the reflector of the Yagi against my chest and turned myself azimuthaly there were two locations, approx 180 deg apart, that gave reasonable values for R & X, two that had R=0, and in between it was anybody's guess.

So, I guess I am being hurt by all the RFI up here, that it's getting picked up by an antenna and fed into the instrument and confusing it somehow. I live atop the mountain which is home to all the TV & Radio transmitters for the Los Angeles basin, placing me about 1~2 miles from about 15MW ERP.

The really bad part about this is, once I put an antenna up I can no longer measure it, which is a bummer for long dipoles which are affected by ground and where I'd like to know the impedance values as a function of height. I laid a 10m dipole close to the ground behind the house and it didn't look *too* terribly bad, but once I put it 30' into the air, R=0 and X~100.

Dave, I had a similar experience recently. I was on a mountain installing a PD201 6 meter antenna on a tower. My partner on the ground kept telling me about the erratic readings he was getting. These readings were inconsistant with anything logical. I could wiggle the coax and it would go down, then come back up. I could grab the mounting bracket in a certain point and it would fluctuate. I even replaced the UHF connector on the feedline before we figured it out. I weatherproofed and secured the feedline and came down off the tower. When we checked the SWR with my Struthers meter, it was reading exactly what the MFJ259B was reading at my house when I was tuning it for 6 meters.

So, I guess the MFJ analyzer is OK for a low RF environment, such as checking antennas at someone's house or a mobile installation, but on a mountaintop with a bunch of other transmitters around, I wouldn't rely on the readings.

As far as the solid state option goes, one of our local hams (former radio service provider) mentioned once that quite a few no-tune hf solid state amps would work fine on 6. If you can find a cb'er with one get it away from him and back in ham hands. Those are often equipped with a low input setting which would match your six watt drive well.

As far as working with 6 watts goes, several years ago we had a radio at field day that put out 8 watts. Using a 3el beam we were able to work all over the western US from TX. When six is open you can do wonders with low power.
thanks, John.

hamorg:kb9lpk@kb9lpk.ampr.org.

Hello all, I have a mint shape Ht1000 VHF package GREAT DEAL!

1) HT1000 VHF 136-174mhz H0KDC9AA3CN like 5 watt mint not a scratch.
1) NOS Like new Battery w/HD belt clip
1) 136-174 mhz like new antenna
1) BDN6676D Surveillance adapter w/PTT switch.
1) NTN7242 Motorola Leather swivel lock holster and t-strap (mint)
1) Motorola 1 hr drop in rapid Charger NTN1171A adjustable slot type
for using a larger capacity battery if you like

Just all checked 100% tested and aligned was used very very little since new!
And verfied by myself personly.

I will ship this unit with 30 day guarantee against any defects that are
not stated in above package!

Will program all 16 channels for 30.00 additional cost if list is provided

Standard Business freq. blue dot CSQ will be in radio. If your a ham radio
operator and provide call sign I will program 146.520 CSQ and one repeater FREE!
$435.00 shipped prepaid US postal money order.

I do accept Pay Pal payment, after it clears deposit in bank its shipped
that day!

This unit was in private standby use use, not public service its like NEW!

Please reply direct to e-mail address thanks...

Contact Com-Spec and get one from them (one of the newer ones)
or use the older SS32...it fits fine and the dipswitch can either
be in the slot of the back cover when the battery cover off OR
you can place it where the knock out is so it is to one side
of the belt clip...take the back off and you will see the
knockout (actually you need a knife to cut it out!)

: > CAn someone tell ,me if the ft50 can have two different tones, one for Tx
: > and one for Rx

What might work is to set up a split RX/TX type thing--Yaesu calls it a duplex split VFO.

In VFO A, you would put your receive frequency and tone, and in VFO B, your transmit frequency and tone. Then enable split VFO operation (menu #8) and it SHOULD work.

I say SHOULD because I haven't actually tried it. I'll leave that one for you. :)

Dennis,

Just take the voltage off one side of the high voltage winding of the transformer you are using for the plate and screen supply. Usa a 1N4007 or similar diode and feed the AC into the Cathode so that you get a negative voltage out. With the proper voltage divider and filtering you will be in business.

I think it great that you are interested in building. It seems that this is becoming increasingly rare these days. The 6146 will give you an easy 50 watts out on six meters.

1703. RS digital meter PEP reading?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-26 00:00:00 UTC
From: Clark Savage Turner <turner@rome.ICS.UCI.EDU>
Message-ID: <200006262017.aa13215@gremlin-relay.ics.uci.edu>
Source record: 76724

I got a Radio Shack digital power/swr meter and used it a little,
I returned it after I found that the peak reading function did not
work. It seemed to be a design flaw, the reading did not "hold"
but kept fluttering around. I met lots of other hams with the same
problem.

I got another meter when they were closed out and just put it away,
it does give good CW power readings, and that was worth something
to me.

At any rate, someone, somewhere told me that the meter would work
if the RF was kept out of the power cord or something. I did not
track it down right away, but wonder now if anyone has had success
with this meter under any conditions to give PEP SSB readings.

No experience with the RS meter. I have had great success with the Yaesu YS-60 peak reading meter. One need only speak normally into the mic and the meter reads true PEP. It is not a peak 'holding' meter however which seems to be what you are after.
It is powered by 13.8vdc and has 2 IC's and 6 transistors. Great meter. Photos on my website.

That's how it is supposed to work. It reads Peak Envelope Power, or
PEP power -- that is, it gives an accurate reading of SSB output.
Meters that don't read PEP power read only Continuous Power, that is
continuous signals such as CW or FM. Some meters read both, and you
can switch between PEP or continuous power.

The word "peak" doesn't mean it is going to read and hold a maximum
reading, like a racing tachometer that might hold peak readings, or
such.

I don't think so. I re-read my instruction manual and it talks about one setting for ctcss. 'course you might try setting the RX and TX frequencies SEPARATELY, then set tones differently under both settings and try it that way, but I'm just not sure.....

As I recall there were no mods for the 3200 to extend its frequency coverage. The reason for the lack of expansion is that the 3200 has a very selective front end which does not lend itself to out of band coverage. I owned one for several years and haven't had a rig with a receiver that good since I sold it.

1712. WTB: NCG 15M 15 meter mobile transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-26 00:00:00 UTC
From: "Caitlyn M. Martin" <caitlyn@netferrets.net>
Message-ID: <3956C604.2E730FC0@netferrets.net>
Source record: 76781

Hi,

I am looking for the NCG 15M mobile transceiver. This is the one with the black face aand the large tuning knob, not the gray faced model with the small silver knobs for each digit (the NCG 15SB). I will also take the Japanese version of this rig, the National RJX-715, and the 6 meter twin of this rig, the National RJX-610. If you have any of the above, please e-mail me with price, condition, and whether or not you have the mic., power cord, manual, mounting bracket, box, or any accessories.

Thanks and 73,
Caity
KU4QD

Andrew,
Rather than spend a lot of money for an antenna you may not
use much, why not try a simple dipole. Not difficult to make,
and you can put one up almost anywhere. If it isn't what you
think you want, your not out much. If you make it your self,
it's even cheaper.

1720. Kenwood TM-D700 some audio & crossband problem(s)

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-26 00:00:00 UTC
From: Hugo pa4la <pa4la@pi4cc.nl>
Message-ID: <8j7bd2$2iin$1@news.kabelfoon.nl>
Source record: 76789

Playing around with the new rig I've noticed some small problems concerning the audio:

1- When using the vollume control it's inpossible to have a (very)low audiospeaker output.
The first volume step is nice during daytime but at night is to loud.

2- When using the rig as a crossband repeater the modulation of the transmitter lacks high
tones and therefore hard to read.

3- In crossband repeat using CTCSS on the recieving band the transmitter triggers on the
normal (carrier) squels, giving a noiseburst on the transmitter output for a second
when no subtone is recieved
Then the CTCSS part starts to work and squelses the output (the transmitter).

Any suggestions

Hugo pa4la

Message-ID: <3958c37e.700831@news.sprint.ca>
Source record: 76650

I have for sale my SG-230 "SmartTuner" HF antenna coupler/tuner. It is in absolutely mint condition, having only been used on an infrequent basis for a few months, in an enclosed location.

This tuner will automatically tune virtually any antenna or wire from 1.8-30 MHz, is microprocessor controlled and has a 10 millisecond retuning time. It has performed flawlessly on a number of different lengths and types of antenna. The unit is completely waterproof and excels as an out of doors remote base loading tuner or on a boat. It is built to almost military specifications. Included are 12 feet of cable and the manual.

I am selling this only because I have no further use for it and I am asking USD $ 275, plus shipping costs. Please email me direct, if interested. 73's

Anyone know who this perso is?He is richcom@earthlink.net.His name is:
Richard Schneider from Coolidge Grove New Jersey.The reason I asked.is that
he has just started to be a pain in my rear end.He posted a want for a 286
laptop.I answered and told him I had a 386 and a 486 that work but needed a
power supply for them.I said they were in the garage and I would chrge the
battery for it.I found out that I forgot that there was only one battery
between the two of them.I emailed him to let this be known.I also gave him
both laptops and two new laptop mice for $85.00.He sent a cashiers check as
I will only acept cashiers check,money order or Paypal.Now after I sent out
all this stuff he wants his money back because his wife wants a laptop with
built in mouse.I am now getting threatening emails and he threatens to bad
mouth me on the news groups and auctions.He hasn't got the stuff yet and he
calls it all junk.
Allk I can say is if he wants to buy from you,Ask him if its ok from his
wife or Momma.
Also he has called my wife all kinds of his pet names that he may use on his
wife.He calls us low class trash and a scam artist.
I am not a scam artist as some that I deal with can say.I have to admit that
this is the second jerk that I have had a problem with.Oh Well.At least he
is leaving someone else alone while he shits on me. BEWARE OF RICHARD

I recently bought three of these drives and discovered the project for which I was buying them did not come thru. They are new and I'm letting them go for 100.00 shipped in US.

They are great for backing up your log files or sharing with your amateur friends.

Separate or together, they are 100 apiece shipped.

Internal and IDE driven, come with software and hardware.

I don't like to sell on ebay and the price is very fair.

1751. NFJ-1020B Active Antenna...?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-27 00:00:00 UTC
From: Bill Crocker <bcrocker@home.com>
Message-ID: <VK965.11784$fR2.146576@news1.rdc1.mi.home.com>
Source record: 76670

I just picked up a new MFJ-1020B Active Antenna, to use on the HF side of my IC-R8500. It can operate from an optional AC power pack, or an internal 9V battery. To try it out, I went the battery route. When I removed the cover, I noticed something that doesn't look right to me. The telescoping whip antenna isn't connected to anything! It's fastened to an insulated, threaded stud, in the bottom of the box, and that's it! The circuit board has antenna connections that are soldered to the Input & Output antenna jacks, but there is no jumper wire connecting the antenna to the board. The schematic shows a connection, using a capacitor in series with it. Any insight on this would be appreciate!

Thanks,
Bill Crocker

1752. Beware of Dick Burke

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-27 00:00:00 UTC
From: richcom@earthlink.net
Message-ID: <395c363f.13162980@news.earthlink.net>
Source record: 76671

He goes under two emails: n1rsp@qsl.net & toby@gis.net

I replied to a post regarding two laptops. Dick told me they had two batteries and no power cords. He told me they did not have built in mouses but would supply a mouse for one. I said fine for $85. He would only accept Cashier's Check. Everything was his way.

After my cc was in the mail, he emails me the next day, Sunday, telling me, oops, sorry only one battery. But I'm throwing in the mouse. Well, the mouse was already in the original deal. So now for my money I'm only getting one battery where I was purchasing TWO.

Now it's not a deal anymore. So I quickly emailed him back and told him that I did not want the deal anymore and to please send back my cashiers check when it arrived.

To verify it, I phoned him on Monday, because NOW he's ignoring my emails. His wife rudely spoke to me and acted stupid. She didn't know where he was or when she would see him. That was the second hint that I was dealing with unscrupulous people.

What a pair! They deserve each other.

So I phoned again that evening and the phone was busy and still no emails.

The next day, he decides to tell me that my check was immediately deposited and my computers were in the mail. WOW, isn't that something, he takes my money and sends me what he wants, which is a lesser deal than agreed upon.

His emails became very foul and abusive. So I am now dealing with a trashy mouthed person. I'm out the $85 but I hope this is a warning to others before dealing with such garbage.

If anyone wants to see his nasty emails. Let me know, I'll send them to you.

I was a gentleman through the whole deal. Something that he can't say

about himself.

So BEWARE of trashy, crooked, lying DICK BURKE.

The moral of the story is: he misrepresented his items, took the money and ran!

He decided to change the deal and I am stuck with it. Is that fair to

anyone out there? You decide.

SO have him mail back the PC's and you send him back the money. What's so hard there Dick? Seems if you are such a nice guy doing such good deals for people it will be real easy to sell these great laptops with mice. You don't even have to "throw them in" you can raise your asking proice and make even MORE money Dick.

Sound like a plan Dick?

I dunno. My local newspaper is full of classified ads for outdated computer equipment. For stuff like this, why not deal with people locally so you can look them in the eye and not get stuck with a bad deal?

I have the IC-T2H. It, along with a $20 radio shack speaker mike, is a really good radio. It is very rugged and if you use alkaline batteries you can talk for many miles. I can hit a repeater that is 18 miles from me using only the rubber duck ant. that it came with.

1770. WANTED: Transmitter info

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-27 00:00:00 UTC
From: Gary Knight <gknight7@gte.net>
Message-ID: <42U55.77$I23.6085@dfiatx1-snr1.gtei.net>
Source record: 76732

Call me crazy ("you're CRAZY") but I want to operate separates. That's the way it was in the old days, and now that I have my ticket back after a few intervening decades, I'd like to pick up where I left off. Have a Drake R8B with which I'm well impressed -- very fine receiver (especially those 5 touch-of-a-button filters, even if they are LCs). But where are the transmitters?

Question: When were the last transmitter manufactured -- date, manufacturer, model number. And any info, comments, recommendations, etc. on any of same. And other than swaps or eBay, any particular sources for acquiring them?

Prefer direct e-mail, but post to newsgroup if you like.

Thanks,

Gary
KD5KQW (excellent excuse for a vanity call, no?)

I second that notion. I know one shouldn't judge radio equipment based on aesthetics but that radio is the ugliest piece of electronic gear I've ever seen. Hopefully it performs better than it looks.

From: Anthony Andrianos <cwmaint@worldnet.att.net>
Message-ID: <39578496.145E@worldnet.att.net>
Source record: 76739

Hello Anybody,

I have for sale a th-78a dual band ht. It is in rough condition, I plead no contest to it`s condition.. I am selling it as a 70cm radio as the 2 mtr side is near deaf. It has a input transistor that has blown and the rxcvr is down @ 20db. Tx on two is great and 440 is great tx &rx. The volume control knob on the uhf side is broken. This means that you must toggle the volume from the vhf side as well as programme it from there also. Again i say it is a beater, Asking 95.00$ & shipping @ 6.00$???

Aside from this near fatal sounding sales pitch is does work well & may make a nice car radio as I gaurentey no intermod on two meters!! I have all of the boxes, every bit of paperwork, even the sales brochure! But that`s not all... I have the soft case, and if you like the quick charger and the 12v battery pack.

If you have any questions about the radio please let me know when to best call you on the phone, give me your time zone as i am on the left coast. Qth nr San francisco. Thank you for the time to read this post.

Source record: 76741

Hi Renee!

Alot of hams seem to like the Hustler 5BTV - It's cheap and appears to work well. (for a vertical).

I would suggest a dipole if you can swing it (or them). When I talk to hams that have both and they switch from vertical to dipole, their signals almost always jump up significantly.

Another cool thing is that dipoles are cheap. Some coax and some wire and you are set. You can make your own 1:1 choke balun by wrapping up the coax near the antenna/coax connect point 6-10 times. U can also spend $15 andf buy a commerical 1:1 balun that also has connection points for the dipole legs and a standard SO-239 female connection to hook your coax direct.

Using a 40m homemade flat top dipole, I've talked all over the states in the wee hours (when I am generally on).

The formula is rather easy:

468/desired middle target frequency. Divide by two to get each sides length.

For example, 468 divided 7.2 mhz (40m SSB) = 65 feet. Divide by two and voila, 32 feet, 6 inches per side.

You can also add more 'legs' for other frequencies.

Best of luck - 73 - Ed - KF6YKM - Southern California

PS - All welcome to check into 7.128.5 around 1230am-ish (PST) - Bunch of great 40m night owls meet there nightly!

> reply direct to me, not just the group...thanks M

Don't know about the atas power limit. As far as the outbacker vs
hamstick, I think depends on the ham stick. Not all are equal, and I see
quite a few different designs. Some quite a bit better than others. Some
ham sticks I think are better than the outbackers, some about equal. The
hamsticks with the short stingers I would think about the same. The ones
with long stingers I bet would be better than the outbacker. Also would
depend on the band also. Really all an outbacker is , is a hamstick that
is "tappable" with the little banana plugs. Not really much difference.
You can make a homebrew hamstick, or "bugstick,plastic bugcatcher,etc"
that would be much better than an outbacker. Thats what I did. I made a
plastic bugcatcher with a pretty big coil. Works great. Also I use a 20m
stick that on 20m is a pretty sorry antenna in itself, as it has almost
no stinger. It's mostly helical winding which is not good. But I use it
on 40m, by adding a 3 ft stinger. On 40m, it works great. About as good
as my big coil antenna. I think using a long stinger, and less windings
the way to go on a "stick" antenna. I don't think the outbackers stinger
is too long. Not sure on it's length, but if it's short, thats gonna
hurt you on the low bands. I rather get the hamsticks and modify to work
better. Cheaper, I bet also. MK

I guess I wasn't very clear in my previous post. I should have said that the 2m and 70cm bands are not influencing my decisions on the radio. I do not really use them nor do I see a need in the future. My question should be, ignoring the 2m and 70cm bands, what are the differences between a 706mII and a 706mIIG.
Jack

Well Bertone, I don't know where you came from cause I never bought
or sold to you. Your comments are totally unnecessary since you seem
as though you haven't read both sides of the story. There was no
fraud on my part at all.

I was promised TWO batteries and he decides to only have ONE
after my check was mailed and the deal still must go on. Everything
is his way with my money.

THat's fair to you? Wow, how can I be the bad guy. And sure hope
they get here, he's got my wrong address in his posting. Whew, he's
all there......

Then I'm glad I never did buy or sell to you.

Regarding your Fraud list. You probably don't know the two sides to
that story either. You're real fair.

I've bought and sold from alot of great people on the net. 99% are
great people.

The Cantenna hasn't been available for 20 years. What you'll find now
may or may not be in perfect working order.

On the other hand, MFJ makes the identical device, 2K rating, and you
can buy it from them with or without industrial-grade transformer oil.

STILL WANT TO KNOW ABOUT POWER AND THE ATAS YOU GUYS..!!
WHAT CAN YOU TELL ME.?

Thanks for your reply on the out backer John, I guess I will get one and try it...Id really like to use the ATAS but I have been told that it wont take my 400 watt mobile amp, which I find necessary out here in west Texas, for 40 and 80....In studying the outbacker and the hamstick(actually I use a heavier versionof same) I cant see why there would be any difference at the the same height...of course the conveneince would be great...I do "whack " my whip (no pun) two to three times a day on the drive thrus of my small coveninece stores...and of course, ocassionally I shut the back door of my van on a hamstick, and have to put a pvc splint on it hi hi...works fine and next time you dont break the PVC...Ill have to have the $300 one, I just cant decide why it would be better...I can change hamsticks as quickly as I change taps....I do use a shunt feed coil on the bottom of the hamsticks...will that be necessary or helpful on the Outbacker...thanks a gain..73 Murray K5MDM

1805. MFJ-986 + Van Gordon Shorty All Bander

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: "Rudolph M. Marcelletti" <rudym@net-link.net>
Message-ID: <395a05a3$0$1492$44a10c7e@news.net-link.net>
Source record: 76607

Anyone using an MFJ-986 tuner with a balanced line Van Gordon Shorty All Bander loaded dipole? I set up one Field Day and could only tune on 80 meters. Cap at 6 and inductor at 47. 100 feet 450 ladder line all the way to tuner. Inverted V up 35 feet on fiberglass mast. Nearest metal was over 50 feet away from antenna. Could not hardly get a match below 5.1:1 on 40,20,15 and had a few spots on 10 that would match. This was the first time I used this tuner on balanced antenna. It works fine on coax fed antennas. The coils on the antenna have continuity through them. I have not had an chance to check it with an different antanna but will soon--full size 160 inverted V up 100 feet with 150 feet of 450 ladder line--no loading coils--and see what happens.

1806. FS: MSR-8000, price typo error

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: gspubl@tca.net
Message-ID: <395a015a.1784455491@news.tamu.edu>
Source record: 76608

FS: Price was incorrectly posted. Also, will consider selling accessories separately from xcvr. MacKay MSR-8000 commercial quality HF tranceiver, AM, USB, LSB,
CW, 125 watts out, 1.6-30Mhz continuous coverage, memories, digital readout, remote control capable. I also have all the neat accessories for it including the matching 35 amp 12vdc supply, matching factory base station microphone, remote antenna tuner with cable, and the factory service manual. This unit is in near mint condition and works exceptionally well. Price should have been $1650 for it all. Mike, (979) 693-1461.

1807. FS: Racal 6217-E HF receiver.

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: gspubl@tca.net
Message-ID: <395a0366.1784979715@news.tamu.edu>
Source record: 76609

FS: Racal 6217E HF receiver. This receiver is the same as the "A" version except that it has 2 extra options, one of which is a preselector. This one is nice looking and works well. It is listed in the Osterman book. It has 5 different IF selectivity positions. I have 2 receivers and I am impressed enough to keep one for myself. With manual, $650. Mike, (979) 693-1461.

1812. Yaesu FC-1000 with Icom IC-756?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: Igor Dobrokhotov <un7gm@qsl.net>
Message-ID: <8jd1mc$fe6$1@mail.nursat.net>
Source record: 76614

Hi folks,
I've bought Yaesu FC-1000 Autotuner for a very reasonable price. The question is how to use it with my Icom IC-756? I suppose what the better way is making PIC converter Icom/Yaesu tuners digital exchange protocol for troubleless using Yaesu tuner like genuine Icom . If anybody has an experience with solution of same problem, please let me know.
73! Igor UN7GM

1813. Need National knob

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: Skip Tyson <skipt1@ix.netcom.com>
Message-ID: <8jd27lenh1@slb0.atl.mindspring.net>
Source record: 76615

National main tunining or band switch knob. It is a approx. 2-3/8 inches in diameter and fluted on the edge. I am restoring a WW2 RAO receiver but it looks like National used this knob on a several models ie. NC-100xa, NC-45, NC-200 and probably many more. I found this this bit of history thrown out on the street on yard clean up day. It had a bad power transformer and had been partially junked out. It is turning into real project! Thank you for taking the time to read this.

1814. FA: ### MOTOROLA MCX-1000 MOBILE RADIO - VHF, 40w, 56ch

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: pdfdisp@aol.com
Message-ID: <20000628102101.12817.00000206@ng-fa1.aol.com>
Source record: 76616

For Sale: Motorola MCX1000 VHF Mobile Radio & Accessories

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365836105

Model#: MBD43UXA7H00AK - Dashmount
56 Channels, & Programmable Zones (Groups)
40 watt output
VHF - 146-174Mhz
Programmable Alphanumeric display for each channel & zone (example "POLICE 1")
LED Lights for Transmit & Busy Channel
CTCSS/DCS/PL/MDC600/MDC1200 capable

Radio Comes With:
Mic & Speaker
Power Plug/Cable
Manual
Antenex 1/4 wave VHF Antenna (Model QW152) & Antenex mini trunk-mount (Model TM8PS) w/PL-259 Connector
RIB Programming Cable worth $65 alone!
I'll also include a copy of the RSS Programming Software for this radio, however I'm unable to get it working on my computer, so it may not be a functional copy. Only included as a possible aid, but no guarantees that it works. (You must have the necessary licenses to use it if it does work.)

This unit is in excellent shape (9 out of 10 cosmetically) and is guaranteed to be in 100% working condition. Selling because it is not needed anymore. I've been told that this package is worth over $800! Reserve price is only $260! Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365836105

Get the cordura nylon case with the spring belt clip. Fully covers the rig
and affords some shock protection. Mine has lasted about 2 years and needs
to be replaced. The radio looks new. Well worth the $27.00. I hear the
radio glove is nice also from some california company, but you can't see the
screen or buttons with that. Mine has a clear plastic front.

I have an IC-R7000 communications receiver which is considered by many
to be top of the line.
IC-R7000 specifications:
Frequency range= 25-1000MHz,1025-2000MHz
Frequency control= CPU based digital PLL synthesizer.Direct frequency
entry.
Memories =99 tunable memories store frequency and mode.
Scanning=full scan,programed scan,mode selected scan,selected
scan,memory channel scan,auto write programed scan & priority scan.
Frequency readout=7 digit fluorescent.
Frequency resolution=SSB,FM/AM,owner selectable
100Hz,1KHz,5KHz,10KHz,12.5KHz,25KHz all modes all bands.
Frequency stability==+or- 5ppm @-10c to +60c
Power supply=117 or 240 VAC
Receiving system=25-1000 MHz FM-N/AM/SSB triple conversion,FM double
conversion:1025-2000 MHz,FM-N/AM/SSB quadruple conversion,FM-W triple
conversion.

I will ship to the lower 48 for $700.00

What have you done so far?

How is it failing?

Which mode?

What kind of sound card? Does it work as a sound card?

Kernel version, etc.?

I am having problems with my vx-1R serial # 0G3301xx. I am having problems with it in scan mode. When I am scanning in the UHF band the &#65533;home channels&#65533; (the preset home frequencies &#65533;vhf-tv, act-2 and fm&#65533;) from other bands keep coming active. I have an other vx-1r that does not have this problem. A friend who has looked at this radio does not have this problem with his vx-1r. I have tried both resets show on pages 46 and 47 of the handbook with no changes to radio.The problem is come and goes. Second problem I am having is some times the radio &#65533;freezes&#65533; I am unable to get any of the buttons to work and it is hard to turn off. This seems to happen with the above problem.

The radio is 3 weeks old. I am thinking about shipping it back. I noted that the packing had changed from my old vx-1, and YEASU changed the serial number sticker it now has "bar codes" on it. I wonder If the have changes firm wear?

Thanks for any help to above

Hello:

Do you know anyone who dreamed about becoming an amateur radio buff in retirement, went out and bought equipment in preparation for that day, and, when the time arrived, let the equipment gather dust?

I'm writing an article for the Wall Street Journal on this topic--not just in the amateur radio arena, but in other hobbies as well. How does this happen? Are such people easy prey for advertisers? Does reality outweigh expectations?

I'd appreciate your thoughts. Thanks!

Hi all;

I am looking into trading an HP 8555A rf module for an HP 8553B rf module.
(It will be used with a 141T mainframe and 8552B IF module)

I have been offered an HP 8553L module. I see that the 'B' version is selling
for nearly 2X what the 'L' is going for.

Can someone who is familiar with both modules please post a list of the
electrical differences between the two modules, if any.

Thanks;

Here is an update to all that are interested. The "paperweights" arrived today. Supposedly, Dick charged the one battery before shipping. Well, it held a trickle of a charge just enough to boot up the computer and then DEAD!

I put the battery in the 2nd computer and absolutely NOTHING! No boot, NOTHING! Put same battery back in first computer and again boots up and computer goes DEAD.

By the way, on the 2nd computer, there is a sticker saying "untested" and then in Dick's writing, there is a sticker saying "works". Ummmmmm, have I been taken.

So good ole Dick sent me a battery ok, but he failed to say that the battery can no longer hold a decent charge for more than a few seconds.

Oh well, anyone out there want Dick's good deal? You can have them for the $85 shipped.

What a joke. Enjoy the money Dick. What goes around comes around.

Can't wait till you meet up with someone that is as low and foul as you and your companion.

I have two words for you, " Postal Inspector ". Since you used a postal money order and sent it through the mail, they may be able to help you. If you used the USPS as the shipper, I know they will be VERY interested. A letter from the postal inspector is as welcome as an audit letter from the IRS! Also you may want to contact the attorney general of the state he lives in. They also can be very helpful. Save those E-mails and any correspondence you had with him. Good luck.

73,
Randy.

Sadly, the post office isn't likely to be much help. My sister got took for a couple grand on an ebay auction from Larry Pizzella WR6K and the post office has done nothing to help.

The California Attorney General asked Larry for his side, and seems to have accepted it, even though the item Larry sold was advertised as "New in Box", and my sister could provide proof from the factory that they'd made two service calls on it.

1838. VX-1R repairs

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: Richard Nielsen <rnielsen@uidaho.edu>
Message-ID: <8jdq7i$785$1@kestrel.csrv.uidaho.edu>
Source record: 76640

I've got a VX-1R that's had problems a couple of times after being dropped. The latest was not far (about 2 ft) and it landed on the rubber duck antenna which I expected would cushion things a bit. The TX is dead on both 144 and 440, and the RX is intermittent on 144, and fine on the FM band.

The first time was under warranty, thank heavens, since the repair bill would nearly have covered the cost of a replacement. The warranty period is over, so I figure I'll have a look inside to see if I can see any loose connections, etc. Anyway, I thought I'd see if anyone had some advice as to places to look once I've got it open.

1841. ?'s about Icom 706MII and MIIG

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: Jack Schuhmacher <jschuh@wt.net>
Message-ID: <395a73ac$1_5@data.wt.net>
Source record: 76643

Besides the change in the 2m band and the addition of 70cm and illuminated keys are their any other differences in the MII and MIIG. The reason I am asking is that I can purchase a new 706MII for about $90. less than the MIIG and was wondering what I would be giving up by not getting the newer version.

Another choice would be the ADI AT-200. The folks at ADI are selling refurbished models for about a hundred bucks at http://www.prymebattery.com/refurb_radios/index.asp . I can't personally comment on this particular radio, but I can say that, based on my experiences with my AT-600, it is probably a very good radio.

Advice for hamfests? Well, "Caveat emptor" sums it up pretty well. You can often find good deals at hamfests, but sometimes you'll get ripped off badly. Make sure you look around for a bit before you decide to plunk down your money.

I am planning to pickup a 2M HT soon, I just pasted my tech. exam.
Here are my basic requirements.

1. I would like to keep the radio under/around $150 US
2. 5 watts output via battery pack.
3. New, 1 Year warranty
4. CTCSS Encode and Decode
5. Touchtone / numeric keypad
6. Alphanumerics would be nice.
7. Under a pound in weight
8. The size of a small match book ..... just kidding!!!

I believe the Alinco 195 and the Yaesu VX-150 both meet my requirements.

Can anyone explain the Pro's and Con's of Unit?
Why or why not buy these units?
Any personal usage feedback would be plus.
Also, can you tell me how much you paid?
Finally, I am going to my fist Hamfest on July 8th,
can you provide any words of wisdoms on how to get the best deal.

Thanks for your knowledge.

Consider the Icom IC-T2H, it has 6 W capability. A friend walks about our small town a lot and I talk to him on his and he puts 8 alkalines in it and it seems to go forever. He does alternate between low and high power, also don't overlook the ADI units, I hear good things about them but have never used on personally. After many years and many HT's, if I had about $150 and could have only one unit, I would look for a good used Alinco DJ-580 or a Yaesu FT-530, with some little preference for the 530. They have all the features ever assembled on one HT. I don't use 440 except rarely but they have dual in band receive so I monitor one 2 meter freq on one side and scan all the rest of 2 meters on the other. I won't be without this feature again.

He is out here a lot. For some reason he also has an axe to grind with me but
he won't say what for. Maybe it's because he is made at my FraudAlert postings
and he thinks he is on the list or he is going to be put on the list.

If you have had either good or bad experiences out here, please make
the appropriate GoodGuy
or FraudAlert postings on the newsgroup.

Use the word "FraudAlert" in the subject box.

GoodGuy if that is appropriate.

What happens is that all the messages here are posted on www.deja.com.

These postings will be there forever for others to read.

All you have to do is go to "www.deja.com" and do a search using a
number of ways
such as name, callsign, email address or whatever else works.

Anything that has ever been posted about that person on ANY newsgroup
will be there for all to see.

Your postings on the newsgroup will alert others as to whether they
should deal with the seller or not as all postings go to www.deja.com

Sometimes, by posting your "FraudAlert" warning either once a week or whenever
you see the guy out
here, they will make them "come around" and settle with you when they realize
they
will not be able to sell
here or anywhere else for that matter. I have even posted this message with my

ads on the auction sites
just to let others be aware to not screw around.

1849. Kenwood th-d7a - weird offset values

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-28 00:00:00 UTC
From: don@kg9qm.ham
Message-ID: <39e65.185$d3.428@news1.iquest.net>
Source record: 76690

This is weird. All of a sudden the offset on my HT is settable only to odd values: .61, .66, .71, etc.

Several memory locations have "junk" (random characters, not numbers) in the offset display and I can't get rid of them.

I did a reset, but they came back.

Anyone else ever see this? A definite "bug" in their firmware, I'd say. I was going to send it back for the upgrade they are doing anyway, so maybe that will fix it.

don

One problem with the Patcomm is that it isn't full QSK (full break-in)
on CW.

I've talked with Patcomm. To me, it's a weird company with weird
only half thought out designs. Like, why no QSK?
Why have a keyboard digital mode interface that only works in CW
and archaic baudot RTTY and not Pactor, etc? On and on...

I think that Ten-Tec makes the best rigs for CW.
I'd pick a used Ten-Tec over a new Patcomm any day.

Source record: 76497

There are a couple of things that come to mind that might be causing that. The first is that if your receiver is connected to an antenna and in the receive mode, then you might just be blocking the front end of your receiver with too much RF. That is a very bad thing to do because it will eventually kill your receiver. One way to protect the receiver from damage is to solder two back-to-back diodes across the antenna input. This will cause high potential RF to go to ground. Normal signals will not be affected. It would be a good idea to disconnect the antenna from the receiver during transmissions anyway.

The second thought is that possibly the receiver is in the standby mode and the audio is shut off during transmissions. I rather doubt that this is the case. I suspect that you are simply trying to listen to your signals with the radio as you transmit. A better solution for this is to build a simple transistor audio oscillator and power it with a little rectified RF energy coming from the transmitter.

1860. Help! Looking for wiring diagram for a Federal Signal PA200

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: ghopper@eskimo.com
Message-ID: <ghopper-2906001222130001@14-082.009.popsite.net>
Source record: 76501
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I just purchased a Federal Signal PA200 (siren and PA) for the purpose of providing an amplified signal from the radio(s) in my truck to a PA speaker on my truck (radio rebroadcast).

The unit has two jones cinch plugs one is a 8 pin and the other is six. The 8 pin one came with a wiring harness with 6 wires: red and black (power), two brown (external speaker, or audio from the radio?), one white (unknown), one green (unknown).

The second plug (six pin) has no wiring harness, so I have no ideas what so ever abou that one.

Any help on this would be appreciated.

Thanks,

Grant Hopper

Hello,

Who knows exactely what capacitors are used inside the antenna tuner
AT4K-BAL ?
Does the AT4K-BAL also contain switchable fixed capacitors, as the AT4K does
?

73,
Gerald (DL8NCP)

1863. Help with Daiwa Antenna Tuner

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: felixtcpip@aol.com
Message-ID: <20000629155426.02625.00001067@ng-cg1.aol.com>
Source record: 76504

Hi,
My friend gave me a Daiwa CW Antenna Tuner. I hooked it up and set the band to 28 (for 10 meters). For some reason I can tune the antenna better when I switch the band knob to 24mhz. Can I still use the tuner on 10 meters if its set to 24 mhz? Or will this break something?

Also the tuner says CW tuner..does that mean i can only use it for CW? No SSB?

Thanks
Felix - KC2DVD

1868. Nokia/Mobira PMR/cellphone ham conversions

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: Gronlund Pentti <benjamin@ele.tut.fi>
Message-ID: <ycrr99gyzk2.fsf@ele.tut.fi>
Source record: 76509

I hope that the headlines were competitive enough to raise your appetite. :-)

Nokia and Mobira are brands that are on sale everywhere. These are the recent cell phones, if you are looking for some 'warez' for them, too bad. Try again...:-)

However, Nokia/Mobira radios have been sold longer than there were any cellular networks, just like Motorola. And when the first NMT cellular networks emerged in the Nordic countries in 1981, there was a Mobira phone available. And, as you can confirm from many public sources, this is the way it has been ever since.

Most phones, starting from that era until the early 90's, have two attractive features when compared to the phones of today. They used a common single-chip CPU like RCA1802/1806, Hitachi HD6303 or Moto 68HC11, and the program was stored on a common DIL EPROM.

The standards we are talking about are NMT450 and NMT900. There is also some plain-vanilla and trunked 80/150/450 MHz equipment. Most of them are Nokia/Mobira, there are also some other Finnish brands like Benefon and Televa, and some Nokia PMR equipment is actually OEM stuff from companies like Kyodo and Philips. We also have links to some pages with conversion info for other European brands.

Well, we took a couple of these beasts, gave them the only treat-ment we know of, and you'll see the rest on our pages:

http://oh3tr.ele.tut.fi/english/modifications.html

The NMT phones have been used in all Nordic countries, Holland, Switzerland, Poland, the Czech Republic, Thailand, Malaysia and in many other countries. The trunked PMR phones have been exported to many European countries like Germany, Holland, Spain and the UK. You can even find them in the Azores or even in Sierra Leone.

The language of the pages has been chosen so that it is understood all over the world. This means bad English. The pages appear also in French, Italian and Spanish. If you think you can help in translating them to e.g. German or to some of the Scandinavian languages, please do not hesitate to contact us.

We are also looking for people who would like to write software and make modification notes for the early Nokia AMPS phones. There is a

possibility to supply a limited quantity of Nokia manuals to reliable third parties, they say ;-)

Remember to relax on the holidays...Wally, this means your retirement, too...:-)

Another fantastic wire antenna is the G5RV. I used one while living in
Alaska and worked all over Europe on 20 meters, some lower 48 on 10,
and a lot of other places on 40 and 80 meters.. Multi-band dipole is
the way to go..

One reply suggested checking the bias supply. When you ground the
amplifier control lead, it closes the T/R relay in the amp and the relay
completes the voltage divider for the bias circuit. This changes the
bias from cut off (I think around -110V) to the operating bias. Place
the meter in the Plate Current position and key the amp(without
talking). If the relay/bias circuit is working correctly you should
see the plate current rise immediately to the resting current - around
90mA. If this happens then I would look elsewhere. If it does not then
check the relay and bias circuitry.

1881. 6MJ6 Tubes for Ameritron AL84

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: Mike <michaelj@networktel.net>
Message-ID: <AtT65.7254$L3.70733@news1.atlantic.net>
Source record: 76522

I am in the middle of rebuilding an Ameritron AL 84. I have two conflicting manuals from Ameritron. One states the unit uses 4 6MJs'6, another says 6LQ6's. Without an old tube guide, I am not sure how this Ameritron was wired. (I can always fire it up with out the tubes and try to figure out the voltages that would go to the pins but there would be no load and the readings would be of little use) I also know the 6LQ6's are far more available and cheaper.

Anyone with experience with this unit, I would appreciate you input.

Thanks
Mike

Felix, please read the friggin' instruction manual that came with your
Sony. Does it receive CW? If so, the manual will tell you how to tune
it in.

The reason I ask, the AES catalog with the big, full page ad for the
Sony 2010 mentions that it receives, AM, FM, Air Band Reception,
SSB... and that's it. NO OTHER MODES ARE MENTIONED.

I have for sale Svetlana 4cx800a & 4cx400a nos tubes. These are new tubes. They have never been used. These tubes were made to the rigid specs of the Russian military. They are very heavy duty tubes. The are every bit as good as any tube offered for sale anywhere! Including the tubes offered for sale by the large commercial tube distributors. The price on the 4cx800a is $200.00 plus shipping for a matched pair and $110.00 for a single. The 4cx400a tubes are $90.00 each plus shipping. You can learn more and see my references at my web site. http://msnhomepages.talkcity.com/ClassifiedsCt/tomstubes/ Thanks for your time.

1886. Alinco DJ-580 HT

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: Cherished <cherished@primary.net>
Message-ID: <J9V65.79$us6.22649@news1.primary.net>
Source record: 76527

Looking to go mobile. The HT just doesn't cut it for me anymore. I have a Alinco DJ-580 Dual Band HT. It has too many features to list here. The manual is included with the radio. Extra speaker mic. Radio has battery attached but the charger is missing. The radio looks good and works perfect. I'm asking $200. If interested please email me at cherished@primary.net

Thanks

1887. Warning! Is Export R US going out of business

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <395C1DAB.1D3466D6@island.net>
Source record: 76528

Export R US keeps warranty radio.

They have my Galaxy 99 for warranty repair which failed in the two days that I had it. It took 6 seeks for it to come to Canada by parcel express which they insist on sending it by. This method is not traceable across the boarder.

After I sent it back for repairs Export R US _s a y_ they sent it by regular post. It is now lost!!!! And I am pissed!!!! They have had my money in CAD since December... $587.86 plus $80 Canadian customs.

To all Canadians do not deal with Export R US.... you will will just waste you money.

BTW Export R US is not answering their phone, E-mail, or phone messages.

John, sorry to hear you're having
trouble with Exports R Us. I went
through my records and found the
following info that you might want for
your records.

1. Radio was received by us on 3/8/00
2. New DX99 ser# 913827 shipped to
Exports R Us on 3/30/00
3. Our outgoing inv# 000911

I just called them and left a message
because they aren't answering
phones for some reason. Keep me posted.

John

From: Len <lburke1@midsouth.rr.com>
Message-ID: <AIx65.5710$sj5.43063@typhoon.midsouth.rr.com>
Source record: 76560

I have noticed that sometimes when I place both hands on my Kenwood MC60A mic feedback occurs (you can actually hear it faintly through the mic element). I recently overheard someone else comment on this phenomenon (same problem, same mic/radio [TS850] combo). Is this a symptom of an RF problem with my station, or is it common to the microphone?

Well if the seller said they worked they should work. I would expect the price to be low on outdated computer stuff, but all of my old computers still work as well as ever. They are not for sale cuz they have a market value of ... well .. zero. If I bought a brand new battery for one them then that unit would have a value equal to the new battery. Not very much. If the battery had been in service for a year... well maybe now its down to fifty bucks and still works well.

All of this is very discouraging. I remember before there were all these money grubbers on the net. I was party to several transactions for hundreds of dollars. Every one of them satisfied *ALL* involved. You wouldn't dare to even think about some of those deals, now. I sent a check for several hundred bucks on its way to the owner of a laptop (a new 386) at the same time he sent the machine my way. My check passed his computer enroute. Both of us were happy. I dare you to try that now!

1896. SB-200 Linear Amp Question

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: goldenbadger@mindspring.com
Message-ID: <395ab60d.9254111@nntp.mindspring.com>
Source record: 76564

I've just picked up an old linear amp from an estate sale, and when I fire it up and key my transmitter, it seems like it takes the amp several seconds to "kick-in." I have never had an amp before and know very litte about them, but it seems that something is not quite right here.

I can even see it on my power meter when going into my dummy load - I key the transmitter and power is nill until about 8 seconds later when it runs up to where it should be.

I have this amp connected to an IC-745, and the amp has been modified with the soft-start and soft-switching circuits available from Halbach Electronics.

Any help would be most appreciated.

Thanks

1897. Re: NFJ-1020B Active Antenna...?

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: Bill Crocker <bcrocker@home.com>

Source record: 76565

For those who care, the MFJ-1020B went back to the store for a full refund. It was constructed very poorly! That antenna not even being wired is inexcusable, especially considering they even go a far as putting a so-called inspection sticker on the bottom of the unit. Obviously they didn't really test it, or even go as far as looking at it! Even the metal cabinet cover wouldn't line-up properly with the front face plate...about 1/8" off to the right! If this is typical of MFJ products, I'm going to avoid them!

1903. Can't hear code

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-29 00:00:00 UTC
From: felixtcpip@aol.com
Message-ID: <20000628234944.04571.00000483@ng-fj1.aol.com>
Source record: 76571

Hi, I just upgraded my license, and got all this expensive radio equipment. But I am having this problem. I have a Sony ICF-2010 Shortwave radio that receives on ham bands. When I transmit CW on 10 meters i can't hear the tone of the code on the shortware radio. I only see the signal strength bar go all the way up. The shortware radio is set into LSB/CW mode. Is this what is heard (or in this case, not heard) on every radio, or just the shortware radio? If this is what is heard on every radio..then what am i doing wrong?

Thanks, Felix

Hi,
Could be something in the bias circuit,
which involves the tube bias and
t/r relay.
I would suggest you subscribe to
the AMPS reflector and post your
question. Some very knowledgeable
people from either professional
amp backgrounds or homebrewers
can help you out.
See www.contesting.com and then
look for the AMPS reflector.
Good luck.

The 2 wall chargers are new I never used them because I used the
Standard CSA160 drop in charger....These are all the items included..

1. TWO (2) Standard C-228A 144/220 MHZ handheld transceiver both in

Excellent Condition
2. TWO (2) Standard CLC-521 Leather Cases
3. TWO (2) Standard CNB-153 7.2 volt 1000mah batteries
4. ONE (1) Standard CNB-151 7.2 volt 700 mah battery
5. ONE (1) Standard CAW-150 cigarette lighter adaptor
6. ONE (1) Standard CSA-160 Quick Charger
7. TWO (2) Yaesu MH-12 speaker/microphones. Which work great on the
Standard handhleds.

AGAIN THE EQUIPMENT IS IN EXCELLENT CONDITION, AND I HAVE ALL THE
PACKING MATERIAL, AND ORIGINAL BOXES.......

.....$715.00 SHIPPED UPS INSURED IN THE UNITED STATES ONLY......

Thank You & 73,

Len,

Hi...

I also had problems with the Kenwood MC60/a mic. This is especially
noticeable when using the amplifier, or when using the built-in preamp.

What I ended up doing was bypassing the UP/DOWN and PTT lines
to ground through a small disc capacitor, about .01 pf.

It seemed that the RF was finding it's way back into the rig, a TS940s,
through these lines. Putting the caps on cured the problem even at 1.5kw.

It's hard to believe that a radio manufacturer would make a radio
accessory that is sensitive to RF, but that's what we have here.
Hope that this helps.

Gary

If the receiver is on the exact frequency as the transmitter, it is what
is refered to as "zero beat", you won't hear any CW. Tune up or down
slightly to find the CW signal.

Source record: 76590

Felix:

If the radio has a LSB/CW receiving mode, it should have a BFO. You cannot receive SSB or CW without a BFO. The BFO should turn on automatically when in LSB/CW mode, but perhaps the radio has a BFO switch that has to be turned on manually. If so, try listening with the BFO turned on.

Cc: jqg@yahoo.com
Subject: [sddxc] SB 1714 California PRB-1, your support is needed

There is a bill now in Committee in the California Legislature SB 1714 which at first was an attempt to have PRB-1 limited federal preemption codified in the California Government Code. A well organized opposition has stripped the language which would have precluded a city of County zoning regulation form regulating ham radio antenna below 75 feet.

Those opposing the bill are well organized, It is critical to the eventual passage of a ham radio friendly statute for the voice of all amateur radio operators, and their supporters, such as those agencies and groups which benefit ad support amateur emergency communications to write, E-mail and call their Assemblyperson to support the passage of SB 1714.

There are at least two ways to find out who your assemblymember and what there address is:

1. Look in the government pages of your local telephone book. There you will find the local office of the assemblymember. Call the local office, and ask for the assemblymember's Sacramento office address.

2. Look at the web page http://www.assembly.ca.gov, and follow the "Find My District" link on the left side of the page. It will ask you for your street address, and return the name and contact information for your assemblymember.

Brad Wyatt, retired ARRL Pacific Division Director, wrote a letter to his assemblymember and the Local government Committee, which ARRL Volunteer Counsel K6HS has modified slightly to make "generic" and which is a good example of what you might say to your assemblymember. In writing your letter, put it in your own words to the extent possible. Otherwise, use parts of it or just copy it.

Be sure to send a copy of your letter to the:

Assembly Local Government Committee
1020 N Street, Room 157

Sacramento, CA 95814.

Here is the letter:

****

Dear Assemblymember <your member>

Senate bill SB-1714 has passed the State Senate, and is now before the Assembly Local Government Committee.

I support this bill and am asking you to support and co-sponsor the bill. Antennas and towers are key to successful communications for the 103,000 Amateur Radio operators in the State of California who are proficiency tested and licensed by the Federal Communications Commission.

As you may know, some cities, towns, and counties have developed land use standards which are so restrictive as to literally prohibit Amateur Radio communication. This bill would be consistent with and complement FCC Regulations, Part 97.15, in requiring municipalities to accommodate Amateur Radio.

The importance of Amateur Radio to California and the rest of the country is expressed well in the FCC rules:

§97.1 Basis and purpose.

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

These objectives cannot be achieved if Amateurs are precluded from pursuing their avocation at home by local actions which impose significant application fees and restrictions which do not, as the federal regulations require, reasonably accommodate the Amateur Radio service.

Please support the enactment of SB-1714.

Very truly yours,

<your name>

cc: Assembly Local Government Committee

****

Please copy and forward this email to everyone you can think of who is
or should be supportative to Ham radio ops.

Source record: 76407
Cross-posted to: alt.ham-radio.mods,rec.radio.amateur.equipment,rec.radio.scanner,rec.radio.swap

Well, this is my last bit of waste of breath on DICK! First of all, he better check his medication because there is NO WHERE IN THE NEWSGROUPS that I posted that I was looking for a 286. He is so confused and crooks so many people, he can't keep track of what he's doing.

Oh, NOW, you say you don't know how good the battery is! WOW, again your lied on the phone and in the emails saying the battery was good and you were giving it a good charge.

Both computers do NOT work. One is completely DEAD! With or without the almost dead battery.

You dumped garbage on me. You sold me two paperweights that will eventually just end up in my garbage pail.

As for your mice, keep them! What good are they if the darn computers are trash!

Please, Dick you and your "companion" are definitely waste of human flesh.

Again, this is my last word on this. I'm sure everyone out here is getting as bored and tired of Dick as I am.

Oh, by the way, in case he changes his name, here's his mailing address so you can cross check and make sure you don't deal with this crook.

Dick Burke
Box 1702
Gloucester, MA 01931-1702 (978)281-3359

Oh, I see another mistake I made, PO Box, that should have also given me a clue when he wouldn't give me a street address. Oh well, live and learn. It was a cheap lesson from a couple of cheap individuals.

A radio must have a BFO in order for a cw signal to make a tone. An example is a CB radio...it does not have a BFO, so when it hears cw it sounds like a repeating dead key. In a ham rig (with a BFO) a dead key sounds like a steady tone. Some of the SWL radios offer the BFO as a option. If not, there is not much to making one.

Greetings:

Well, most of it is in the Subject line, however, I know of the Linux platform JAVA based program. What I am really looking for is a Windows NT/2000 based program that will allow remote control and interconnection of the Icom PCR-100/1000 radio and the Internet.

All of my current configurations are Windows NT 4.0/2000 Server varieties utilizing IIS 4/5 and I don't want to bring on an additional system just for Linux.

If anyone has any ideas you can post them to this News group, however, please also post them directly to me as well: n3yyp@arrl.net .

Thank you,

Cliff Owen

Okay two laptops for $85 is probably too good to be true...and it obviously was. The point is Mr Burkes integrity and truthfulness. Regardless of the "too good to be true" price, if Mr Burke represented them as being functional, and from the postings here they weren't, price is irrelevant.

As bystanders to this discussion
only richcom@earthlink.net and Dick Burke knows what was actually said. If it sounds too good to be true, it probably is.

Hello,

I recently aquired an Astron RS20A supply. This is the noisiest supply I have ever owned. It appears that the transformer is vibrating, and causing the cabinet to make noise. I have tried to quiet it by using rubber washers around the cabinet, but it still annoys me. Is this normal for the Astron supply? Should I try another one?

Thanks,

Chris VE6RDC

Hi -

If you can try another one, do so. Otherwise, check that the screws holding the transformer laminations are as tight. Also check whether the top cover might be in contact with the top of the transformer. If it is, separate them. A rubber grommet or a hose washer or two glued to the top of the transformer will help to keep them separated. If the transformer is not overheating (normal operating temp will be too hot to hold your hand on, but won't blister it) and the output voltage is normal, then I wouldn't worry about whether its operating properly or not.

1952. Need FAST Radio Repair on Alinco

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-30 00:00:00 UTC
From: Joe <k7joe@yahoo.com>
Message-ID: <395CCE06.F6D4BD@yahoo.com>
Source record: 76420
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Hi,
I finally managed to blow up my 6 year old Alinco DX70T
after lots of mobile and DX use. This time, it went south
while on a huge antenna during field day. I suspect some
static buildup blew the diodes....rig was not grounded.

I suspect the problem is a couple transistors or
diodes went south in the bandpass filter. This is a
common failure. However:

1. Dont have replacement parts readily available
2. Am gun shy to do SMT work
3. Need the repair done fast -- Alinco wants $100 minimum
and 4 to 6 weeks turn around. That's rediculous.

This should be about 30 minutes of labor. Need to find
a tech in the northwest that I can deliver or 2 day ship
the rig and have it back in a week. Am traveling overseas
soon. Need the rig to come with me. Any suggestions?

thanks,
Joe

We have 2 issues here, regardless of the childish sniping.

1. One person, IMHO wants something for nothing....And whines when he runs into someone who gives him two (crummy) computers for the cost of a modest family meal.. "Caveat Emptor". Which I believe means "Cease the Whining" does it not???

2. The other person when, initially whined at (very irritating I'll agree) , immdiately disclaims any responsiblity. Extremely high weasel factor here. You should make this good for the schmuck. Take your door stops back.

I wouldn't trust either of you to dog-sit. It seems to me that you two deserve each other. Please, oh please go away. Both of you.

My RS-20A hums a lot, too. It's a good thing it doesn't hum some
recognizable tune - that'd drive me NUTS.

See if you can reduce the hum by pressing down on/into the cabinet
pieces. I eliminated a lot of hum by folding up a small piece of
paper and inserting it between the front panel and the top of the
cabinet.

One thing the original poster has not mentioned is whether he can hear
other CW signals properly. If he does, his radio is simply being
overloaded by his own signal. If he doesn't...

Message-ID: <8applssu3ta9mmketubrd1ot5bhb7tivt7@4ax.com>
Source record: 76430

Most likely the "band" switch selects different coils on the inductor,
so set it where you get the best match, with the best forward power,
and ignore the "band" markings.

I'm not sure on the CW vs CW/SSB question, although I know of no
reason why it wouldn't work on both.

1964. FS: 2 METER MINI HT

Newsgroup: rec.radio.amateur.equipment
Date: 2000-06-30 00:00:00 UTC
From: Patrick Mason <Jimmyk@mindspring.com>
Message-ID: <8jisb0ohh1@nntp9.atl.mindspring.net>
Source record: 76432

I have a Standard-C168A VHF mini HT for sale.

It is a 9 in condition on a scale of 1-10, just a scratch or two on the back where the belt clip is.

It is a 5 watt unit with 1 12 volt nicad battery included and a 3 watt unit with a 7.2 volt nicad battery included. Also included are two alkaline battery cases, the 7.2 volt charger and an adapter for a 12-13.8 volt power supply to charge the 12 volt nicad.

The unit is 3 years old and operates perfectly. Extra 40 channel memory unit included. It featers CTCSS tone encode/decode as well as a leather carrying case and external speaker/mic.

Original box and manual included. 30 day warrantee, no questions asked.

Am asking $150 firm.

Thanks for reading this far down,

73

Patrick

Not bad, however I can't help but make one comment.
Don't take it as a put down but rather as a suggestion.

On the personal picture section of your web page the statement
under one pic said something like this: "I spend 50% of my time on the
radio and 50% of my time on the computer." This is obvious if you
look at the picture.

It would be better if you could some day post a new improved picture
and a explaination below that says: "I spend 33% of my time on the
radio, 33% of the time on the computer, and another 33% of my time
looking after my health.

1967. Re: Astron Supply Hum?

We used an Astron PS commercially also and had that problem. A short burst
of hum, intermittant in nature and non stoppable. I would contact ASTRON
and see if they can shed some light on it.

I have in good condition two 212Z-1 Remote Amplifiers. These are solid state, 4 Channel AC or Battery operated portables in cases for on the spot broadcasts. Freq response 50-15KHz gain 90dB. These are excellent for AM Transmitters requiring line level audio input. Built in 400Hz tone for setups and program monitor for headphones. All XLR inputs and also telephone connections. With a really large VU Meter in the center makes it a real great addition to any station. $395 each plus shipping.

Just picked up a unique receiver of sorts. Its a Decca DAL 222 Marine receiver. Dual Automatic Loran. It has a built in scope, two digital displays (the red tube types), a bottom panel for adjusting the scope and selecting which display. This one is setup to operate on 12v to 48v DC. It is in perfect condition inside and out. Has a serial plug for a remote on the back. Its approx. 7 inches high, 16 wide and 18" deep. Back panal reads: ITT Decca Marine, Automatic Loran A Receiver.

Can anyone tell me anything about this rig other than the above. What frequencies? How to operate. Setup and usage?

Would greatly appreciate it.

I have a Multi-Elmac PSR-612 Power Supply for the Elmac PMR-6/7/8.
It is in very good to great shape! This power supply could also be
used to power up some other piece of equipment that requires high
voltage. The input is 6 & 12 VDC, and the output would be high
voltage. I am not sure what the output is, I would assume something
like 175-250 Volts, 350 volts and 6 volts, and possible 700-900 volts.
It is currently going for a great price and there is NO reserve!

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

Frankly John,

If you are asking this question the project is probably beyond your ability.
You will just end up frustrated, with lots of burned out parts and a new
apreciation of WHY they charge $$$ to design and sell sine wave inverters.
Buy the inverter.

Now having said this, if I can help you I will.
I recomend a crystal standard for the 60 cycle source.
Divide it down to 60 Hz from some higher frequency.
A PIC and PWm is a good approach.
Power FETs are decent devices.
Finding the transformer is a bear!
Expect to SPEND 2,000 watts DC to produce 1,000 watts sine wave,
and if you get better..., laugh!

Most of the rigs used now do not have anything like a BFO. They are
using product detectors. The product detector works fine for ssb and CW
and most any digital signal and beter than most of the older rigs using
a BFO. Get with the times, the BFO went out in the late 60' and 70's.
Unless there is a detector being used in comsumer products that I am not
awear of, any receiver that will copy ssb will copy cw just fine. It
might not have the filtering desired for cw in a crowded band, but it
will copy cw just fine.

Two of the 486 class laptops for $ 85 is probably right. They are
getting to be old , the hard drives are probably going to need replacing
soon,will not run the desiriable softwear, the batteries are worth more
than the computers, could go on. Look at the computers at the shows and
hamfests. The 486 computers are selling for very little if at all.
About the only reason to buy one is to get the case and that is fast
becomming obsolete as the newer ATX style motherboards are comming out.
I jsut sold one off for about $ 40 that included a 14 inch monitor. The
only reason I got that much out of it was because it would cost that
much for the 3 inch floppy and case. It was bought to get a person on
the free JUNO e-mail. He is using it to comunicate as his son can not
hear well enough to use the telephone and they can not/ won't pay for a
good computer for the internet.

PunkEar wrote:

Intermittently, I'm not able to access my local 440 repeater that requires a PL tone of 114.8. What might be the problem, and how could I fix it? I am confident enough to go inside my radio. :-)

This may be happening on 2m as well, but I haven't had the chance to check that yet. The 2m repeater I use most often doesn't require a tone.

Thanks!

Ryan

HI All,

I have for sale a nice Yaesu FT-900AT HF radio. Looks and works 100%!! I
reciently sent it in to yaesu for check out and updates a few months back.
This radio has the built in auto tuner and is very fast!!
I have the remote mounting kit for it also if you want to remote the head
for mobile application. (This has not been used).
$750 plus shipping.

Please remove "X" from my email address.
Thanks
Gary N7GB

Did you check that you have the tone option module
installed. Open the top cover where the speaker is. Remove
the two rear screws on the cover, then the 4 screws on the
sides. Two on each side of the top cover. Look in the
front center, just behind the front panel. You will have 3
connectors there. The one on the left is for the front
panel. The other two are for the tone module.

Jim

Hi Fred,
You know those pictures of me were taken in Oct 1999. Since then I have
been 'looking after my health' and have been following a weight loss plan that
is been prescribed by my primary care physician. I have come down from 313lbs
to 270 and am going for more.
I hope this meets with your approval.

Oh, it's in there, I can get into the repeaters most of the time, but there have been a few times where I can't. I'm beginning to think it's just a heat problem.

I don't have the decode module, but the encode module's in there. Anyway, I hope it's heat and not the radio going south on me!

I have a mint EDX2 auto tuner I would like to sell/trade. This tuner will plug directly into the DX70/DX77 HF radios, or can be rewired to work with most any HF rig. I have gone mobile and don't require it anymore. Paid $549 Canadian, approx. $300 US. Will sell for $150 US or trade for any sort of HF gear. If you have something laying around collecting dust, let me know, I might be interested.

You can view at http://www.alinco.com/usa.html

Please reply direct as I dot check the newsgroups too often.

Were there tubes in it? I'd use what was in it , if you know what they
were. Also the 6mj6 number doesn't sound right to me. I bet it's
supposed to be 6jm6. It's possible they are interchangable, but I'm not
sure. I 'd make sure before you buy any. Seems to me, the 6lq6 seems
more popular to me. If you know the tube to be used, the charts are in
the back of OLD ARRL handbooks and maybe other books. I'd find the
diagram for that amp, to be sure of the circuit. You might try the amp
reflector. I bet someone there knows all about it. MK

$90 ???Gosh, order me one too. Maybe you mean 900...To be honest, I
think the newest version has a little better audio. Quite a bit better
than the original 706. Or I think anyway...A friend of mine, bought a
new MIIg, a few months ago, and I was expecting lackluster audio
compared to his TS 450. But danged, if I almost prefer the icom. The
thing sounds REAL good. The original ones kinda pinchy sounding. Not
sure about the MII. But I'll gladly pay $90 for one anyway. g MK

You might have to search for the exact frequency to get a beat tone. The ICF2010 may not be displaying the same frequency as your transmitter is tuned for. Tune up and down +/- 2 kHz in small steps.

Hi
I have an Astron RS-35A that is quite as a church mouse,even when running a 100 watt cw carrier.Is your Astron new, or an older one?I just bought mine new about a month ago.Maybe the new models addressed this complaint.
I was using a 20 amp supply of some off name brand, and it hummed liked crazy when transmitting.It was so bad that the mic would pick it up.Now with the Astron, I don't even know it's there.
Good luck,I hope you resolve you problem.Maybe a newer supply would be quite.

If you're thinking about replacing the Astron then you might want to consider the Astron switching supplies. I have a SS-20 on my 706 for 3 years now with no trouble whatsoever. They're also smaller and lighter than the old analog supplies.

Just a thought.

I'm getting ready to buy a Yaesu FT-920, but as is my practice - I want to get some opinions from people who have used the radio before I plunk down my cash.

I've read the QST review and it's not too bad for a radio in this price range - but one thing that concerns me is the reported 'filter blow by' I keep hearing about in the news group. Can someone explain what this problem is? Also, I understand Inrad has a fix for it - is it worth the money... ??

For that matter, is the radio worth the money?

Opinions appreciated - here in the news group please - address is fake to throw off the Spammers...

Worth is subjective. I see a lot of things on ebay that IMHO are not
collectors items or rare in any way going for way more than I think they
should based on my knowledge of what the item is and what I would pay
for it. When something sells for way more than what I think it is worth
I usually smile and wonder why the buyer spent so much on it.

However, I have noticed lately that there are a good amount of ham
related items not reaching their reserve price. Sometimes I just think
that people list items at high reserve just to get a feel for how high
the bidding will go. In some respects I like the option of the "Buy
Price" listing on the Yahoo auctions.

Just connect it to your computer via the serial port and you have a 100KHz-30MHz All mode general coverage Receiver with good filtering and it even has a bandscope. Yes it is the new model with up to 8kc bandwidth. This receiver is like new and comes with the telescopic antenna, power supply and software. New updated software is always available for download from the TenTec site. $225 shipped.

Source record: 76355

I appreciate that Rich:
1) Labeled his postings "FA" rather than "FS"
2) Did not include images of his items which are also available at the auction site

BUT

He is a commercial enterprise, MAG Electronics, and already has a commercial web site. Are we to tolerate ads here from Texas Towers or HRO even though they may be having "good deals"?

Mag Electronics also continues to repost items throughout the auction which I consider particularly crass since most subscribers read the group frequently enough to catch the posting within the auction period. If there were a way to filter out such activity from lsitserver mail as one can from newsgroup postings, I might be more tolerant. I am frankly surprised that the administrator of this list has condoned Mag Electronics postings to this point.

The combination of a commercial enterprise advertising auctions in this group is particulary annoying.

Therefore, I feel Rich, MAG Electronics, has been abusing his marginal privilege to post on Ham-Equip Mailing List and Newsgroup and exercise my right as a citizen of cyberspace to label his posts as SPAM and Rich a SPAMMER.

You are sentenced to face the fact you can't have it both ways. Your enterprise has outgrown the status that has permitted your postings here previously. Please stop.

To answer in advance all those who may write and ask, "Who made you the cop/judge/jury of the Internet?" I respond, "Today is my turn!"

Hi:

I have come accross something for the persons who still Service, Program,
or still use the MX300 (S) Series Radios. Some of these parts are NO LONGER
AVAILIBLE FROM MOTOROLA. Included, but not limited too:

(32) RPX4416A Blank Program Code Plug (All Sealed in the Plastic Bag)
(6) NLD7350A (VHF COntroller) $319.00 / $218.00ea Wholesale From ~/\/\~
(8) NFN6009A (Filter PL) $44.00 / $33.10 ea From Motorola
(6) NLD 6603A (VHF VCO) $70.00 / $52.00ea From Mototola
(3) NLN9531A (??) 118.00 / 83.ea from Motorola
(4) NLN9530A (??) 94.00 / 67.00ea From Motorola
(8) NLD6612B (PA) $81.00 / $56.00ea from Motorola
(4) NLN5925A (Disc) $20.00 / $14.00ea From Motorola
(5) NLN8775B (rx Audio) $56.00 / $41.00ea from Motorola
(2) NLN4052N (PL Processor) ????.
==========

==========

So if you are one of those die hards that still uses these older series
radios for their Performance, and need any / all of these parts, please
feel free to email me with a offer.

Its a good rig, I would'ent worry much about so called "filter blowby"
whatever that means. If you want more selectivity then purchase the
optional International Radios' filters, otherwise enjoy the good radio
as it is. I think you'll like it. Dale J.

Hello Jerry,

I have been running an FT-920 for about 2 years now. It replaced a Kenwood TS-850s/at. I originally got it to add the 6 meter all mode function, but after using it for some time I feel that it is overall a very good rig. I have had no problems with it so far.

In my location, the 920 has a better noise floor than the 850, most of the time I have little or no noise level with the 920, where as the 850 always ran around 2-3 "S" units of noise. I compared both rigs side by side for a few months before I sold the 850, and although the 850 seemed a bit more sensitive than the 920, the lower noise floor of the 920 allowed me to hear weaker signals better, especially when using the AF DSP - which works extremely well for an AF unit.

A purely aesthetic thing I like is that it is a large radio. It has knobs and buttons that you can get to easily, and the most frequently used features are controlled form the front panel. Unlike most of the newer radios, you do not need to muddle through a ton of menus to set or adjust common features.

Regarding the filter blow-by issue, I have added the Inrad filters to my radio and although it helps somewhat, it is still an issue when there is a strong wideband local station within 5-10 mhz. Turning off the noise blanker will reduce the splatter- sometimes completely, and other times it will only

reduce it somewhat. However, I had the same problem with the 850. Both radios were affected by strong local wideband signals, but my subjective opinion is that the 920 does as well or better than the 850 in this respect. I should make it clear that I am referring to splatter from a wideband signal- not front end overload. A strong local signal from a clean station is not a problem.

I have worked all over the world with 100 watts and a home brew multiband wire at about 35 feet. I get many 5-9 reports and comments of excellent audio with the 920. If you are looking for a contest grade rig and price is no object, you should probably look at a FT-1000D or the new 1000 MK5, however ...

Considering the price of the 920, you are getting a lot of "bang for the buck". It has a ton of features, works very well, and is reliable. I doubt you can find a better rig for the price, especially if you find a clean used one like I did. I paid $1000.00 for mine two years ago, and have had no regrets.

I hope this info helps you in your decision process, but remember it is just an opinion, your mileage may vary... I would suggest that you try to get some time on the air with one, maybe at a dealer or a club station. This is the best way to discover if this rig is for you.

As I recall the TR2200A was rated at two watts but it could possibly have
been five. In any case it sounds as though it is developing rated power.
If it receives and has some useful crystals I'd say you got a great buy!

I posted then looked in my Radio Shack catalog and see an Audio output
transformer (273-1380). I guess my only reservation is that I have never
seen something like this and wouldn't have a clue which wire goes where.

Is that the shoulder-pack 2meter rig?? 12 or so crystal dial with built in telescopic antenna and battery pack??

TR2200 rings a bell -- if it is what I think it is, I bought one when they were new -- about 1976 I think.
Was a 2 watt rig. Finally traded it in for a crystal HT when they were available :) $5 is quite a bargain.

2050. Icom R 7000

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-01 00:00:00 UTC
From: Charles Schuler <Charles.Schuler@worldnet.att.net>
Message-ID: <395E7055.24B72223@worldnet.att.net>
Source record: 76376

Covers 25 MHz to 2 GHz. AM, FW wide, FM narrow,
SSB. 99 memory channels, keyboard entry, variable
pitch tuning, 6 scanning functions, voice scan control,
S-meter squelch.

Also comes with an external converter to receive frequencies
from 100 kHz to 25 MHz. The converter uses up-conversion
and a 100 MHz L.O.; thus the digital dial is correct
(ignoring the left-hand "1").

Very good condition. Have manual. $890.00.

Located in S.W. PA. Convenient to I-70, I-79 and I-43.

I have an IC-R7000 communications receiver which is considered by many to be top of the line,the rig is in excellent condition and comes with the original manual.
IC-R7000 specifications:
Frequency range= 25-1000MHz,1025-2000MHz
Frequency control= CPU based digital PLL synthesizer.Direct frequency entry.
Memories =99 tunable memories store frequency and mode.
Scanning=full scan,programed scan,mode selected scan,selected scan,memory channel scan,auto write programed scan & priority scan.
Frequency readout=7 digit fluorescent.
Frequency resolution=SSB,FM/AM,owner selectable 100Hz,1KHz,5KHz,10KHz,12.5KHz,25KHz all modes all bands.
Frequency stability==+or- 5ppm @-10c to +60c
Power supply=117 or 240 VAC
Receiving system=25-1000 MHz FM-N/AM/SSB triple conversion,FM double conversion:1025-2000 MHz,FM-N/AM/SSB quadruple conversion,FM-W triple conversion.

I will ship to the lower 48 for $700.00

Regards
Bob Stamper

2061. Icom IC-746 and digital modes

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-01 00:00:00 UTC
From: "H. Peter Anvin" <hpa@zytor.com>
Message-ID: <8jmjahiso1@cesium.transmeta.com>
Source record: 76387

Hello friends,

Having just passed my Extra I'm in the market for a good MF/HF rig. I have read glowing reviews of the Icom IC-746, the feature set seems to match closely what I consider valuable, and it is (just barely) in my pricerange. The only thing I haven't been able to find out is how this rig does on digital modes that require rapid recv/xmit switching. I am very interested in these kinds of modes; in fact, experimenting with digital modes is most likely going to be my main interest in HF.

Thus, I would very much like to hear from anyone who has been using this rig for digital modes and hear the good, the bad, and the ugly.

Sorry, Ralph, but that "BFO" is still in there and still doing the same job as always. It just isn't called that anymore and does not have a knob on the front panel for setting the frequency and turning it on and off.

The "product detector" requires an appropriate injection frequency signal in order to produce baseband audio, whether the modulation is SSB or CW or ?? And that signal is produced by our old friend the BFO. Only, these days, it is commonly synthesized or derived from the main synthesizer chain with an appropriate offset depending upon the mode.

Remember the old days when SSB first came out? Turn off the AVC (that was its name in those days!) and back off the RF Gain. Tune for max S-meter activity and then turn on the BFO and set it for most intelligible audio. I got to where I could do that with my old HRO-5TA1 with my eyes closed! How I wish I had that radio back again . . .

2064. Astron Power Supply Hum (Update)

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-01 00:00:00 UTC
From: dorn@freenet.edmonton.ab.ca
Message-ID: <8jjfdu$7e4$1@pulp.srv.ualberta.ca>
Source record: 76473

Hello again,

Thanks for all the replies and suggestions. I spent a few hours today working on this supply. I made sure that all the nuts and bolts on the transformer were tight. Then, I stuffed little bits of cardboard in various spots around the cabinet shell where it meets the front panel. The cardboard seems to have smoothed out most of the cabinet noise, but the transformer is still a little noisy, I think I can live with the level of noise now, but it's still not the best. From what I can gather, this is a fairly common problem with the Astron supply as they have not isolated the transformer from the cabinet. For those of you who suggested contacting Astron - I did so 3 days ago via e-mail, and they haven't replied. I wouldn't be surprised if they have heard this complaint before. Live and learn I guess...

I am trying to find a 600 ohm element for an Astatic desk microphone. I have two one is white and one is red but I am led to believe, due to the low audio reports, that the impedence is wrong. Does anyone have any info such as the color I should be looking for, if that is how you tell the impedence. Since nothing is marked on the elements I am assuming the color is the way of telling the impedence.

Thanks

Barry

I have a Yaesu FL 2100B Linear Amplifier in need of repair.

I am very non-technical and the problem is beyond me. I believe
the problem will be a minor component.

Can anyone recommend a place where I can get this repaired?
Preferably in the Illinois or Iowa area. I live in west central
Illinois.

Please advise. TIA

Bob W9GXT

Ken gave excellent advise. The "CW" might be some bright marketing idea. It might also imply that power ratings are for cw. CW (Morse code) and SSB do not produce a 100% duty cycle. RTTY, AM, an FM do. You will probably have to reduce power below what the label says is maximum if you use the tuner for those modes. SSB should be okay.

Watch for heating of the internal parts.

I own a Vertex VX-150 ... quite an amazing unit in the price range
you're looking!

My company also has the ADI AT-201 for a little less money (I have seen
them at Ham Radio Outlet stores for only $139.95). More details on it
are available at:

http://www.adi-radio.com/amateurradio/handhelds/mono/Default.htm

The AT-201 has 40 memory channels, programmable band scan, automatic
repeater offset, frequency or channel display, and more. The unit has a
rugged metal chassis and nicely backlit keypad. It comes standard with a
12 volt battery, which provides 5 watts of RF power, perfect for
accessing those distant repeaters.

Transmit Range: 144-148 MHz
Receive Range: 130-179 MHz
MARS and CAP capable (permits are required)
5-watts output (with 12 VDC)
40 memory channels store any offset or tone
CTCSS encode and decode included
programmable band and memory scan modes
DTMF paging included
dual frequency watch
auto-repeater offset
user-selectable frequency or channel display modes
backlit display and keypad
Size: 4.25" (H) x 2" (W) x 1.3" (D) excluding battery pack

Message-ID: <2rC75.2637$xL3.187589@bgtnsc06-news.ops.worldnet.att.net>
Source record: 76300

Ryan,
I've had the same problem with my 8100, the transmit tone will just stop working. You can listen to it on another rig and it's not there at all. Mine didn't seem to be heat related since sometimes it wouldn't work when you first turned it on.
Sent it back to Yaesu for repair but it was so intermittent that they couldn't duplicate the problem. Mark from Yaesu called me and told me all the things they had tried, (heat, cold, you name it). The last time it came back I've not seen the problem but with something intermittent how do you really know :)

73 Mark KU4MP
Ryan Faricy <ryan@faricy.net> wrote in message
news:5Pa75.2383$iN5.551279@ptah.visi.com...
Intermittently, I'm not able to access my local 440 repeater that requires a PL tone of 114.8. What might be the problem, and how could I fix it? I am confident enough to go inside my radio. :-)

This may be happening on 2m as well, but I haven't had the chance to check that yet. The 2m repeater I use most often doesn't require a tone.

Thanks!

Ryan

Message-ID: <20000702102102.01264.00001094@ng-cn1.aol.com>
Source record: 76305

Go with the Alinco 195T or the Yaesu Vx-150, & forget the ADI. here's some REAL info on all 3:
1) They all can currently be bought for under $150.
2) The Alinco & Yaesu are both VERY rugged & feature packed, the ADI is more "plastic & flimsy"
3) The Alinco & Yaesu are both ALPHANUMERIC, the ADI isn't.
4) Both the Alinco & Yaesu are Computer programmable (w/ optional RT sys software) the ADI isn't.
5) The Yaesu has over 100 memories, the Alinco has 40 & also has a built-in "ultra-sonic Mosquito repeller mode" & a theft alarm mode built in.
6) The Yaesu & Alinco are also more compact than the ADI, & don't use the plastic rail "slide on the bottom" battery system of the ADI.
Originally, Tiawan made ADi radios were about $50 cheaper than the Japanese name brands, but recently they sell for the same price & are no longer a good value. The ADI rigs are also "old" designs that have been sold for over a decade with minor cosmetic/memory changes only over the last 12 years.....

2097. Re: Icom IC-746 and digital modes

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-02 00:00:00 UTC
From: Seth Miller <sethmiller73@email.com>
Message-ID: <395F52F9.D80C09B2@email.com>
Source record: 76306

Hi Peter,

FWIW, I own a 746 and use it almost exclusively on the digital modes. Using Pactor I and II, AMTOR, RTTY, PSK31, Hell, etc. I have never had a problem. The T/R transfer time is very fast (8 ms, according to ARRL tests) so no problem there. The frequency stability (at least on my sample) is also very good, always reliably within 5-10 Hz after a 30 min. warmup as measured on a service monitor with a high-stab timebase. I have the TXCO option installed in my IC-706 but it just doesn't seem necessary to purchase one for the 746. You might want to also get an optional 500 Hz IF filter, sometimes handy when trying to keep strong adjacent-channel signals out of the AGC. You can find them used for $75 or so and is a good investment for digital work, but not mandatory

Hope this helps.

- Seth N6BMB

After successfully using an MFJ Model 949E to tune a 170 foot inverted "L" on all bands from 160 through 10 for about four years, I am scratching my head as to why a new Ameritron ATR-30 will not tune as effectively and does not exhibit the same tuning behaviour.

Both the 949E and ATR-30 are Pi Network tuners, with the ATR-30 featuring twice the capacity (500 mfd vs 250 mfd) in both the antenna and transmitter capacitors - and providing a rugged, roller inductor of at least 24 microhenry value rather than just a tapped coil. Both of the ATR-30 capacitors are on mechanical verniers, suggesting that it should tune very smoothly and more accurately than its much less expensive, 300-Watt rated "little brother".

Surprisingly, I have found that the ATR-30 will not tune the inverted "L" below 2.4:1.0 at 1995 KHz and is still above 1.7:1.0 at 1950 KHz, only attaining a 1:1 match when the frequency is below 1915 KHz. The 949E attained 1:1 everywhere, on all bands, generally requiring a dip of one capacitor followed by a dip of the second, then a return to the first for touchup - with one or two "back and forths" finally producing a 1:1 condition. I call this the "progressive VSWR diminishment feature".

Not only does the ATR not meet its specification in that portion of the 160 metre band, it also has more difficulty attaining 1:1 in many other bands - and I never see the progressive VSWR diminishment feature. Moving from one capacitor back to the other never improves the VSWR situation and, on many bands, one of the capacitors ends up being set to zero.

Is there something wrong with my ATR-30? (I have checked the units' wiring against the schematic and everything looks fine inside, with good quality components and assembly techniques evident throughout.)

Why does the ATR-30 not tune the same way as the 949E, even though they both are the same configuration?

The price differential between these units is quite substantial and I had expected to get at least the same, if not better, performance from the ATR-30. It does support the use of 1 kW output on all bands, including 160 metres, which was not possible on the 949E. Power handling on 160m is why

I bought the Ameritron; otherwise I would have stayed with the MFJ.

I also have a Viewstar VS1500, an SPC configuration tuner, which is rated at 1500 Watts and which tunes everything everywhere 1:1 without any trouble - but which arcs and sparks whenever I try to get above 400 Watts into it on 160 metres. It is the best tuner that I have seen in terms of tuning almost any type of antenna.

Comments and suggestions solicited.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

From: w2zr@aol.com
Message-ID: <20000702182106.24505.00000731@ng-cc1.aol.com>
Source record: 76317

I have a Jones Key iambic paddle. This paddle has a very heavy metal base. It's much heavier than a Bencher. The base is painted red (original) and the rest of the paddle is brass. The two paddle arms each swing in a pair of roller bearings for extremely smooth action. The paddle is in excellent condition, virtually without a flaw. I'm the original owner and have only used it a few times. I'll bubble wrap it and ship it for $150.

Hello Gary,

Like you I would love to rebuild my Novice station which consisted of a
SX-110, DX-40, Johnson 6n2 vhf converter, Ameco TX 62, and a Heath Twoer.

As to the seperate transmitter question, I think that Rockwell / Collins
was producing the last version of the S line up until the mid 80s, and

Kenwood Produced the R-599D / T599D into the early 80s. Yaesu also had separates up until the late 70s or early 80s. It is an interesting question.

Sounds like you are having fun with yout Dx-100 and Sx99.

2110. Transmit audio too hot on ADI AR-247

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-02 00:00:00 UTC
From: Kent <kentp@scc.net>
Message-ID: <395FC774.7E5D873F@scc.net>
Source record: 76319

My ADI AR-247 - the 220 mobile rig - on the air. It came out of the box with no schematic. I have way too much audio on transmit, I end up hitting the audio clipper on the local repeaters. There are 5 pots on the board, none labeled as to function. Has anyone had any experience with the innards of this radio? I need to decrease the transmit audio without getting on the deviation pot!

Thanks,

Kent

2111. FA: Keypad for Collins KWM-380

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-02 00:00:00 UTC
From: jbr101@my-deja.com
Message-ID: <8joj2t$f7b$1@nnrp1.deja.com>
Source record: 76320
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

I have a keypad for the Collins KWM-380 for auction on eBay.

The URL is

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=372565399

and the description is

This is a near mint-condition keypad for the Collins KWM-380 HF transceiver.When used with the interface board in your radio, enables direct frequency entry from the keypad, storage of displayed frequency into one of 10 memories, recall of frequencies stored in memory, and "stepping through the frequencies stored in memory. The stepping feature is especially nice for contesting. This is a heavy metal brute, weighs around two pounds and is mounted on a rubber slab so it stays put on your operating table. Comes with documentation, cable and connector all ready to plug into your '380 and go. This is in like-new condition, owned by a non-smoker who rarely used it. I honestly don't think you could tell it from new. The last time I saw a KWM-380 keypad advertised retail it was close to $300, starting bid is about 1/6 of that; I don't even know if they're still available anywhere else but right here on good ol' eBay.

Closes 7/09/00.

Thank-you

Sent via Deja.com http://www.deja.com/

Dennis, I have seen this behavior before but can't remember exactly what caused
it. A soft cell in the battery pack can cause it, so make sure your batteries
are in good condition. I have operating manuals and schematics for the IC-2AT.
I can copy if you want or I may even have an extra instruction manual
w/schematic and board layout diagrams.

Let me know if I can be of any help to you.

Since the radio just came out, I doubt if many people have experience
with it. But you might look for the July issue of QST. They reviewed
the 718, and the review was generally positive. The review is also up
at the ARRL web site, where you can check out reviews for just about
every rig, going back 20 years.

Date: 2000-07-03 00:00:00 UTC
From: "Colin B. Marks" <cbm@zip.com.au>
Message-ID: <39609AFA.4C067811@zip.com.au>
Source record: 76249

The tuning knob on my FT-990 has suddenly jammed solid. This was not a gradual process - five minutes earlier it was working perfectly.
I am wondering if this is easily fixed in my shack or is it a part replacement job for the Yaesu distributers?
Any comments would be appreciated - preferably by email. Thanks

73 Colin VK2LV Sydney Australia

HI All,

I have for sale a nice Yaesu FT-900AT HF radio. Looks and works 100%!! I
reciently sent it in to yaesu for check out and updates a few months back.
This radio has the built in auto tuner and is very fast!!
I have the remote mounting kit for it also if you want to remote the head
for mobile application. (This has not been used).

$750 plus shipping.

Thanks
Gary N7GB

2132. FS 2 mtr base TS-711A/TU-5/IF-10A

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: Jerry <n6vg@lanset.com>
Message-ID: <3960c36b@monitor.lanset.com>
Source record: 76255

I have a Kenwood TS-711A two meter base station for sale with the hard to find TU-5 tone encoder and IF-10A computer interface. I have never used the IF-10A but it is supposed to be good. Comes with hand mike and manuals but no box. Very good condition. Asking $550 shipped from Sacramento, CA. Thanks, Jerry.

2133. FS: Ranger RCI-2950

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: jrerleweREMOVE@mtu.edu
Message-ID: <slrn8m1gl7.olc.jrerleweREMOVE@techsrv1.tech.mtu.edu>
Source record: 76256

Hello,
I'd like to sell my Ranger RCI-2950 10m mobile radio.
I just don't use it a lot anymore, and frenkly am looking at a FT-100
since my other dualband radio is dying anyway. Plus I need more space in
my crappy Ford ranger anyway... I'm not blessed with an extended cab or
budget. So anyway, it's in good condition, very clean, works great, sounds
great, and has an Astatic Red Devil mic on it as an upgrade. It *is*
modified to cover the Chicken Bands I guess, but I don't use that feature
much. Any other questions, feel free to ask.

I'm not really even sure what this is worth, maybe I should go check Ebay
or something. Anyway, I'll consider rational offers.

Radio shack had a unit that's hooks up to your stereo TV (could be your computer) and transmits to a small receiver w/ a stereo headphone jack (connect to hi-fi). I would assume they still sell them. Mine works fine.

2136. LAST DAY! FA: Multi-Elmac PSR-612 Power Supply for PMR-6/7/8

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: radiotek@pacbell.net
Message-ID: <3960caf7.2005942@news.pacbell.net>
Source record: 76259

I have a nice Multi-Elmac High Voltage 6/12VDC Input Power Supply for the PMR-6/7/8 for auction. This power supply takes 6/12 VDC input and the output would be the voltages needed to power up the radio. I would say that these voltages would be: 6, 75-125, 250-350 and possibly 700-900 volts. So, this may be used for the PMR-6/7/8 or for powering up a different radio that requires those types of voltages. This is the LAST DAY and there is no reserve! I would say that this was made in the 1950's-1960's era.

2139. Paging Repeater Help

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: gzenk@pionet.net
Message-ID: <8jqjqr$s5i$1@nnrp1.deja.com>
Source record: 76262

One of the fire departments in our area is looking for something that will repeat their pages after the original page from dispatch. They are about 15 miles away from the base station but due to several large hills, they have trouble receiving their pages. They would like to have something in their station that would record only their page and then repeat it on a transmitter at their station. Having it record and repeat all traffic on the frequency is not an option, as the same frequency is used for paging and other fire communications.

Any help or ideas on this would be appreciated!!

Thanks.

2145. FOR SALE - ALINCO DJ-S41T with extended receive and transmit

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: jcsarp@aol.com
Message-ID: <20000703163203.18260.00001320@ng-fd1.aol.com>
Source record: 76268

FOR SALE - ALINCO DJ-S41T with extended receive and transmit.

This Alinco DJ-S41T (70 cm HT) is in MINT condition. It has only been used a few times and looks like brand new. It receives AND transmits from 421.300 MHz to 478.300 MHz. Only the early versions of this radio can be easily modified to receive below and above the 70 cm amateur band. This unit is an early version. It makes an excellent 70 cm amateur radio AND works great on the new FRS (Family Radio Service) band located at 462 MHz and 467 MHz. This DJ-S41T also works very well on the GMRS band.

The radio is for sale as a package deal with the following:

Early Version Alinco DJ-S41T
421.300 to 478.300 MHz receive and transmit
1400 mAh NEXcell NiMH batteries
Alinco EDC-78 battery charger
Alinco ESC-27 soft carry case
Belkin swivel clip (radio clips on your belt like a cell phone)
Original factory box
Owners manual

DJ-S41T SPECIFICATIONS

GENERAL
Frequency Coverage MHz (RX) 425.000-449.995 (TX) 425.000-449.995 MHz<
Channel Spacing: 5, 10, 12.5, 15, 20, 25KHz steps
Memory Channels: 20 Channels + 1 Call Channel Memory
Antenna Impedance: 50 Ohms Unbalance
Frequency Stability: +/-5 ppm
Microphone Input Impedance: 2K Ohms Nominal
Signal Type: F3E (FM)
Power Supply Requirements: 3.6V ~ 4.5V DC (4.5V standard with 3 AA batteries)
Current Consumption@4.5V: Transmitting: Approx. 260mA (High Power Receiving: Approx. 33mA Squelched)
Operating Temperature: -10 to +60 Degrees Celsius 14 to 140 Degrees Fahrenheit
Ground: Negative
Dimensions (Radio Only): 2-1/6(W) x 4(H) x 1-1/10(D) Inches
Weight: Approx. 6.5oz. (Batteries Included)
Sub Audible Tones Encoder Installed (50 Tones)

TRANSMITTER
Output Power High: Approx.340mW Low:Approx. 50mW
Emission Mode F3E (FM)
Modulation System Variable Reactance FM
Max. Freq. Deviation +/- 5KHz
Spurious Emission -60dB Or Under Below Carrier Level

If it works for CW, it will certainly work for SSB. If the tuner in
any way specifies CW, it may be that the meter is accurate only for a
continuous signal, such as what you get from CW, as opposed to the PEP
measurement required for SSB...

2153. FS: SG-230 SmartTuner antenna tuner

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: lagagnon@fakesprint.ca
Message-ID: <396120e2.2800685@news.sprint.ca>
Source record: 76276

I have for sale my SG-230 "SmartTuner" HF antenna coupler/tuner. It is in absolutely mint condition, having only been used on an infrequent basis for a few months, in an enclosed location.

This tuner will automatically tune virtually any antenna or wire from 1.8-30 MHz, is microprocessor controlled and has a 10 millisecond retuning time. It has performed flawlessly on a number of different lengths and types of antenna. The unit is completely waterproof and excels as an out of doors remote base loading tuner or on a boat. It is built to almost military specifications. Included are 12 feet of cable and the manual.

I am selling this only because I have no further use for it and I am asking USD $ 275, plus shipping costs. Please email me direct, if interested. 73's

2154. FS: Yaesu FT-2500M 2M FM transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: lagagnon@fakesprint.ca
Message-ID: <396120e9.2808036@news.sprint.ca>
Source record: 76277

I have for sale my Yaesu FT-2500M two metre FM transceiver. It is in perfect condition. This rig is built to military specifications and is extremely rugged, well built and the controls are easy to use. Perfect for use in 4WD and pick-up trucks. Includes CTSS, DTMF, keypad mic, mobile mount, power cord and manual.

I am selling this radio only because I have lost interest in 2M FM. My price is USD $150 plus shipping. Please email me direct if interested.

2155. FS: ICOM 735 HF transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-03 00:00:00 UTC
From: lagagnon@fakesprint.ca
Message-ID: <396120f1.2815686@news.sprint.ca>
Source record: 76278

I have for sale my IC-735 HF transceiver. This radio is one of ICOM's best HF designs, has an excellent receiver, withstands significant abuse, lasts almost forever. Included are the CW keyer and 400 Hz CW filter options, plus mobile mount and mobile power cord. There are minor scratches on the outer case, otherwise in perfect working order. I have never had a problem with this radio.

I am selling it for USD $ 500, or best offer, plus shipping. Please email me direct if you are interested.

Thanks...Larry Gagnon VE6/MW0AWC

Hi Bill,

If I were you, I would E-mail MFJ or Ameritron (They're both the same company), and tell them that you bought their more expensive tuner, expecting it to be able to match at least what their cheaper one could, and you are V E R Y disappointed with their product. If the capacitors and the inductor are larger units. the tuner "should" be able to match a wider variation of impedance.

PS. I've ordered a service manual and don't intend
"dancing-in-the-dark" when adjusting this radio. However I am on
holidays at the moment and the manual may not arrive until *after*
they've finished. So I would at least like to get the IC-735 working a
little better than it is at the moment. I'm relatively new to radio and
so do not want to spend my holidays off the air! Hence my call for
help...

Cheers,
Nicholas - VK5CX

Source record: 76345

I have been a ham for 15 years and have seen it all. When a new radio comes out they don't sicount it. I bet you will see the DSP included in say 6 months. Also, the optional filters are 45 KHZ and cost close to $ 200 each. Also no FM mode so kiss the 10 meter FM away (popular). If the radio included the DSP i would say OK but since it doesn't I would suggest a Icom 706 MK II G for $950 from Texas Towers.
For the extra $ 200 you are getting 2 mtr, 440 mhz 6 meters plus the optional filters are around $100 if you want them plus they plug in vs solder in for the IC-718.

good luck, Steve

Thanks for the input. The instructions for my Henry amp call for full output for a few seconds. I was trying to find an easy way to do it without using the key so I would have both hands free. I am going to try the string of dits technique anyway to see if I can achieve full output with that method. I might also try using a shorted plug in the hand key jack so I can just put the exciter in CW mode and push the transmit button.

You can reach me at w6ccd@arrl.net or remove the Gold and Wing from this address. Got tired of spam.

In rec.radio.amateur.antenna Myron Steir <msteir@earthlink.net> wrote:
: Has anyone had any experience with the Icom Automatic antenna tuners?
: Is it worth the price?

I have an Icom AT 150 on my IC-745 and it works great.

: I'm using an apartment type antenna, the B&W AP10, and I'm wondering if
: an automatic antenna tuner for my Icom 725 would simplify using that
: antenna?

Keep in mind that that auto antenna tuner won't tune an antenna that is as far off as some of the heftier manual tuners will. They just don't have the ability. If you are going to try to cover a number of bands on a poor antenna then you probably won't have very good luck with one of the Icom AT turners. You would probably be better off buying one of the hefty manual jobs that will tune a rock to whatever frequency you want.

But other wise I'm glad I got the auto tuner for my radio.

2184. Age old question - 920 vs 570

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-04 00:00:00 UTC
From: Jay <mstr-jl>

Hi all,

My son has just passed his Tech license exam, and as a reward I would like to get him a decent HF rig to start hamm'n with. I want to stay under $1500 until I make sure his interest will withstand the test of time.

He loves using Morse code and his only interest (for now at least) is chasing DX - says he has no interest in SSB at all.

In my price range, I'm considering the Yaesu 920 (with an optional cw filter) or the Kenwood 570 (without 6mtrs - with cw filter).

I would appreciate any comments from users of either radio as to what would be the best rig for his interests. Thanks for any assistance -

Jay

You won't hurt that henry with a full key up. Just don't sit there too awful long... Most all amps can handle a full power key up for 15-20 seconds anyway. You won't hurt em. If an amp is so puny not to be able to key up for tuning, it's not even worth messing with. The dynamic range and regulation would be lousy on voice peaks. Amps are made to be keyed up. Thats the only way you can accuratly tune them. Won't faze a henry. And don't worry about the transformer humm you will likely hear. It won't hurt anything.I run a 2k classic. Also have a heath sb-200 also though. It's not near as stout as the henry, but it still will have no problem with a full keydown for a few seconds. But I still like the keyer/pecker to save everyday wear and tear. MK

The SGC-230 might fall into that category. I once forgot to install the upper portion of my mobile antenna on the five foot Hustler bottom section for a shootout. The SGC-230 faithfully loaded that five foot section on 75m. I'm making no claims for any kind of efficiency, but the above actually happened. 73, Cec

For sale in very good condition. Kenwood TS-711a 2 meter base
with the TU-5 tone encoder, IF-10A computer interface, manuals
and hand mike but no box. I have not used the IF-10A but it is
supposed to be ok. Asking $550 shipped OBRO. May consider
a Yaesu VR-500 in part trade. Jerry in Sacramento, CA.

2191. Radio low voltage

Newsgroup: rec.radio.amateur.equipment
Date: 2000-07-04 00:00:00 UTC
From: Jerry Abrams <jabramsxyz@hoflink.com>
Message-ID: <3962AFAF.35BA2DD8@hoflink.com>
Source record: 76156

I have a Yaeseu FT 4700 dual band remote radio in my 1996 Lexus. I have a power lead directly from the battery to the trunk mounted radio, a ground is connected in the engine compartment. There is very negligible loss in the cable (< 1/4 volt) from the measurement at the battery and at the radio. When stopped at a traffic light, with the A/C on, headlights on, the radio shuts off during high power transmit. The car voltage at that point is slightly below 12 volts. After complaining about the low voltage, the alternator and battery were just replaced (free of charge - under warranty), but the problem still occurs. When a similar radio (I have 2 identical ones) was in my previous car, I never had that problem. Is there an internal voltage adjust in the radio to lower the threshold voltage. When testing the radio with the engine off, headlights on, there is no dimming of the headlights when tranmitting.

Am I missing something? You tried a computer with a battery that had
been off charg for several days, it dies after booting, and then you
"check" the second computer with the same dead battery- taking its
failure as evidence that the computer is bad?

At this point, I dont see that you have made a valid test on anything.
Until you test the computers with known good batteries, or a power
supply, you dont know enough to have a complaint.

I use cw. You want to use full power in order to fully load the amp, so I always use cw. Many times I'll use my electronic keyer as a reduced duty "pecker" to see my loading and grid current without keying a full bore KW plus signal. But I still start out with a full dead key when setting the normal loading setting for an amp. I use the keyer/pecker as an indicator. IE: I only load my amp fully and set loading every few months or when I have an antenna change. So all the later times, I just set the loading to the preset load position, and hit the keyer to look at the grid. If the grid is ok, I'm set to go, and really don't even have to tune up. I think grid current the most accurate indicator of loading. If you use a low power for amp tuning, you run a real risk of spatter etc. from underloading. BTW, I have a "tune" switch on the back of my keyer to key the rig. MK

Does anyone have a copy of the manual with a schematic for the
McKay-Dymek DR-101 receiver?

Anyone know of a parts source or have spare parts?

Tnx,
Doug

Some rigs have FSK or RTTY modes, which provide a carrier at full output
by pressing the mic button. FM does the same, however, I seem to
remember that FM was not suggested on class AB amplifiers. Dont recall
exactly where I heard this or if I heard it correctly. anyway....

A hand key, set on the floor and used as a foot switch is what I usually
use in a pinch(tuning in CW mode). This method keeps both hands free for
"driving" (to dip the plate and peak the grid) while allowing quick
key/unkeying.

The best approach is a "machine gun" -- a device that turns the
TX on and off like a machine gun. Such carrier bursts allow
one to adjust the amp with far less stress than a continuous carrier.
A CW iambic keyer set to 60+ WPM and keying the "dit" side works well
for this application. It is the best approach that I've come
across in 16 yrs of hamming.

Thanks. I was wondering about this control too. However it is used to match the actual frequency received/transmitted to that of the display. I looked at the block diagram in the user manual and figured the relevant trimmer caps must be on the main board somewhere next to the LSB/CW BFO crystal and the USB/AM/FM crystal. While listening to a time signal I tried one of the trimcaps and sure enough, the signal on USB started shifting back into the passband! I was lucky first time. I tried a second trim cap and this seemed to adjust the LSB. As far as I can tell, USB and LSB now sound the same! Also the power output on both bands seems about the same. So, lucky me! Just need a transmit test which I'll pick up on a receiver and record on my computer, USB and LSB, to see what they sound like "live" (actually on a dummy load).

Cheers,
Nicholas
